Abstract. We pioneer a new technique that allows us to prove a multitude of previously open simulations in QBF proof complexity. In particular, we show that extended QBF Frege p-simulates clausal proof systems such as IR-Calculus, IRM-Calculus, Long-Distance Q-Resolution, and Merge Resolution. These results are obtained by taking a technique of Beyersdorff et al. (JACM 2020) that turns strategy extraction into simulation and combining it with new local strategy extraction arguments.

This approach leads to simulations that are carried out mainly in propositional logic, with minimal use of the QBF rules. Our proofs therefore provide a new, largely propositional interpretation of the simulated systems. We argue that these results strengthen the case for uniform certification in QBF solving, since many QBF proof systems now fall into place underneath extended QBF Frege.

1. Introduction

The problem of evaluating Quantified Boolean Formulas (QBF), an extension of propositional satisfiability (SAT), is a canonical PSPACE-complete problem [SM73, AB09]. Many tasks in verification, synthesis and reasoning have succinct QBF encodings [SBPS19], making QBF a natural target logic for automated reasoning. As such, QBF has seen considerable interest from the SAT community, leading to the development of a variety of QBF solvers (e.g., [LB10, JKMC16, RT15, JM15b, PSS19a]). The underlying algorithms are often highly nontrivial, and their implementation can lead to subtle bugs [BLB10]. While formal verification of solvers is typically impractical, trust in a solver’s output can be established by having it generate a proof trace that can be externally validated. This is already standard in SAT solving with the DRAT proof system [WHJ14], for which even formally verified checkers are available [CHJ17]. A key requirement for standard proof formats like DRAT is that they simulate all current and emerging proof techniques.

Currently, there is no decided-upon checking format for QBF proofs (although there have been some suggestions [JBS17, HSB17]). The main challenge of finding such an universal format, is that QBF solvers are so radically different in their proof techniques,

Key words and phrases: QBF, Proof Complexity, Verification, Frege, Extended Frege, Strategy Extraction.

This work was supported by the Vienna Science and Technology Fund (WWTF) under grant ICT19-060.
that each solver basically works in its own proof system. For instance, solvers based on CDCL and (some) clausal abstraction solvers can generate proofs in Q-resolution (Q-Res) [KKF95] or long-distance Q-resolution (LD-Q-Res) [BJ12], while the proof system underlying expansion based solvers combines instantiation of universally quantified variables with resolution (∀Exp+Res) [JM15a]. Variants of the latter system have been considered: IR-cal (Instantiation Resolution) admits instantiation with partial assignments, and IRM-cal (Instantiation Resolution Merge) additionally incorporates elements of long-distance Q-resolution [BCJ19].

A universal checking format for QBF ought to simulate all of these systems. A good candidate for such a proof system has been identified in extended QBF Frege (eFrege + ∀red): Beyersdorff et al. showed [BBCP20] that a lower bound for eFrege + ∀red would not be possible without a major breakthrough.

In this work, we show that eFrege + ∀red does indeed p-simulate IRM-cal, Merge Resolution (M-Res) and LQU + Res (a generalisation of LD-Q-Res), thereby establishing eFrege + ∀red and any stronger system (e.g., QRAT [HSB17] or G [KP90]) as potential universal checking formats in QBF. As corollaries, we obtain (known) simulations of ∀Exp+Res [KHS17] and LD-Q-Res [KS19] by QRAT, as well as a (new) simulation of IR-cal by QRAT, answering a question recently posed by Chede and Shukla [CS21]. A simulation structure with many of the known QBF proof systems and our new results is given in Figure 1.

Figure 1: Hasse diagram for polynomial simulation order of QBF calculi [BCJ19, BWJ14, BBCP20, HSB17, Che21, BJ12, VG12, CH22, BBM18]. In this diagram all proof systems below the first line are known to have strategy extraction, and all below the second line have an exponential lower bound. G and QRAT have strategy extraction if and only if P = PSPACE.

Our proofs crucially rely on a property of QBF proof systems known as strategy extraction. Here, “strategy” refers to winning strategies of a set of PSPACE two-player games (see Section 2 for more details) each of which corresponds exactly to some QBF. A proof system is said to have strategy extraction if a strategy for the two-player game associated with a QBF can be computed from a proof of the formula in polynomial time.
Balabanov and Jiang discovered [BJ12] that Q-Resolution admitted a form of strategy extraction where a circuit computing a winning strategy could be extracted in linear time from the proofs. Strategy extraction was subsequently proven for many QBF proof systems (cf. Figure 1): the expansion based systems $\forall\text{Exp}+\text{Res}$ [BCJ19], IR-calc [BCJ19] and IRM-calc [BCJ19], Long-Distance Q-Resolution [ELW13], including with dependency schemes [ELW13], Merge Resolution [BBM18], Relaxing Stratex [Che16] and C-Frege + $\forall$red systems including eFrege + $\forall$red [BBCP20]. Strategy extraction also gained notoriety because it became a method to show Q-resolution lower bounds [BCJ19]. Beyersdorff et al. [BBCP20, BCMS18] generalised this approach to more powerful proof systems, allowing them to establish a tight correspondence between lower bounds for eFrege + $\forall$red and two major open problems in circuit complexity and propositional proof complexity: they showed that proving a lower bound for eFrege + $\forall$red is equivalent to either proving a lower bound for P/poly or a lower bound for propositional eFrege. It was conjectured by Chew [Che21] that all the aforementioned proof systems that had strategy extraction were very likely to be simulated by eFrege + $\forall$red. An outline of how to use strategy extraction to obtain the corresponding simulations was also provided.

We follow this outline in proving simulations for multiple systems by eFrege + $\forall$red. While the strategy extraction for expansion based systems [BCJ19] has been known for a while using the technique from Goultiaeva et. al [GVB11], there currently is no intuitive way to formalise this strategy extraction into a simulation proof. Here we specifically studied a new strategy extraction technique given by Schlaipfer et al. [SSWZ20], that creates local strategies for each $\forall\text{Exp}+\text{Res}$ line. Inductively, we can affirm each of these local strategies and prove the full strategy extraction this way. This local strategy extraction technique is based on arguments of Suda and Gleiss [SG18], which allow it to be generalised to the expansion based system IRM-calc. We thus manage to prove a simulation for $\forall\text{Exp}+\text{Res}$ and generalise it to IR-calc and then to IRM-calc. We also show a much more straightforward simulation of M-Res and an adaptation of the IRM-calc argument to LQU$^+$-Res.

The remainder of the paper is structured as follows. In Section 2 we go over general preliminaries and the definition of eFrege + $\forall$red. The remaining sections are each dedicated to simulations of different calculi by eFrege + $\forall$red. In Section 3 we begin with a simulation of M-Res as a relatively easy example.

In Section 4 we find show how eFrege + $\forall$red simulates expansion based systems. We find a propositional interpretation and a local strategy for IR-calc. This leads to a full simulation of IR-calc by eFrege + $\forall$red. In Section 5 we extend this simulation to IRM-calc which involves dealing with merged literals. In Section 6 we study the strongest CDCL proof system LQU$^+$-Res and explain why it is also simulated by eFrege + $\forall$red, using a similar argument to IRM-calc. We leave some of the finer details of the simulation of IRM-calc and LQU$^+$-Res in the Appendix.

2. Preliminaries

2.1. Quantified Boolean Formulas. A Quantified Boolean Formula (QBF) is a propositional formula augmented with Boolean quantifiers $\forall, \exists$ that range over the Boolean values $\bot, \top$ (the same as 0, 1). Every propositional formula is already a QBF. Let $\phi$ be a QBF. The semantics of the quantifiers are that: $\forall x \phi(x) \equiv \phi(\bot) \land \phi(\top)$ and $\exists x \phi(x) \equiv \phi(\bot) \lor \phi(\top)$. 
When investigating QBF in computer science we want to standardise the input formula. In a prenex QBF, all quantifiers appear outermost in a (quantifier) prefix, and are followed by a propositional formula, called the matrix. If every propositional variable of the matrix is bound by some quantifier in the prefix we say the QBF is a closed prenex QBF. We often want to standardise the propositional matrix, and so we can take the same approach as seen often in propositional logic. We denote the set of universal variables as $U$, and the set of existential variables as $E$. A literal is a propositional variable ($x$) or its negation ($\neg x$ or $\bar{x}$). A clause is a disjunction of literals. Since disjunction is idempotent, associative and commutative we can think of a clause simultaneously as a set of literals. The empty clause is just false. A conjunctive normal form (CNF) is a conjunction of clauses. Again, since conjunction is idempotent, associative and commutative a CNF can be seen as set of clauses. The empty CNF is true, and a CNF containing an empty clause is false. Every propositional formula has an equivalent formula in CNF, we therefore restrict our focus to closed PCNF QBFs, that is closed prenex QBFs with CNF matrices.

2.2. QBF Proof Systems.

2.2.1. Proof Complexity. A proof system [CR79] is a polynomial-time checking function that checks that every proof maps to a valid theorem. Different proof systems have varying strengths, in one system a theorem may require very long proofs, in another the proofs could be considerably shorter. We use proof complexity to analyse the strength of proof systems [Kra19]. A proof system is said to have an $\Omega(f(n))$-lower bound, if there is a family of theorems such that shortest proof (in number of symbols) of the family are bounded below by $\Omega(f(n))$ where $n$ is the size (in number of symbols) of the theorem. Proof system $p$ is said to simulate proof system $q$ if there is a fixed polynomial $P(x)$ such that for every $q$-proof $\pi$ of every theorem $y$ there is a $p$-proof of $y$ no bigger than $P(|\pi|)$ where $|\pi|$ denotes the size of $\pi$. A stricter condition, proof system $p$ is said to $p$-simulate proof system $q$ if there is a polynomial-time algorithm that takes $q$-proofs to $p$-proofs preserving the theorem.

2.2.2. Extended Frege+$\forall$-Red. Frege systems are “text-book” style proof systems for propositional logic. They consist of a finite set of axioms and rules where any variable can be replaced by any formula (so each rule and axiom is actually a schema). A Frege system needs also to be sound and complete. Frege systems are incredibly powerful and can handle simple tautologies with ease. No lower bounds are known for Frege systems and all Frege systems are p-equivalent [CR79, Rec76]. For these reasons we can assume all Frege-systems can handle simple tautologies and syllogisms without going into details.

Extended Frege (eFrege) takes a Frege system and allows the introduction of new variables that do not appear in any previous line of the proof. These variables abbreviate formulas, but since new variables can be consecutively nested, they can be understood to represent circuits. The rule works by introducing the axiom of $v \leftrightarrow f$ for new variable $v$ (not appearing in the formula $f$). Alternatively one can consider eFrege as the system where lines are circuits instead of formulas.

Extended Frege is a very powerful system, it was shown [Kra95, Bey99] that any propositional proof system $f$ can be simulated by eFrege + ||$\phi$|| where $\phi$ is a polynomially recognisable axiom scheme. The QBF analogue is eFrege + $\forall$red, which adds the reduction rule to all existing eFrege rules [BBCP20]. eFrege + $\forall$red is refutationally sound and complete.
for closed prenex QBFs. The reduction rules allows one to substitute a universal variable in a formula with \( \bot \) or with \( \top \) as long as no other variable appearing in that formula is right of it in the prefix. Extension variables now must appear in the prefix and must be quantified right of the variables used to define it, we can consider them to be defined immediately right of these variables as there is no disadvantage to this.

2.3. QBF Strategies. With a closed prenex QBF \( \Pi \phi \), the semantics of a QBF has an alternative definition in games. The two-player QBF game has an \( \exists \)-player and a \( \forall \)-player. The game is played in order of the prefix \( \Pi \) left-to-right, whoever’s quantifier appears must assign the quantified variable to \( \bot \) or \( \top \). The existential player is trying to make the matrix \( \phi \) become true. The universal player is trying to make the matrix become false. \( \Pi \phi \) is true if and only if there winning strategy for the \( \exists \) player. \( \Pi \phi \) is false if and only if there winning strategy for the \( \forall \) player.

A strategy for a false QBF is a set of functions \( f_u \) for each universal variable \( u \) on variables left of \( u \) in the prefix. In a winning strategy the propositional matrix must evaluate to false when every \( u \) is replaced by \( f_u \). A QBF proof system has strategy extraction if there is a polynomial time program that takes in a refutation \( \pi \) of some QBF \( \Psi \) and outputs circuits that represent the functions of a winning strategy.

A policy is similarly defined as a strategy but with partial functions for each universal variables instead of a fully defined function.

3. Extended Frege+\( \forall \)-Red p-simulates M-Res

In this section we show a first example of how the eFrege + \( \forall \)red simulation argument works in practice for systems that have strategy extraction. Merge resolution provides a straightforward example because the strategies themselves are very suitable to be managed in propositional logic. In later theorems where we simulate calculi like IR-calc and IRM-calc, representing strategies is much more of a challenge.

3.1. Merge Resolution. Merge resolution (M-Res) was first defined by Beyersdorff, Blinkhorn and Mahajan [BBM18]. Its lines combine clausal information with a merge map, for each universal variable. Merge maps give a “local” strategy which when followed forces the clause to be true or the original CNF to be false.

3.1.1. Definition of Merge Resolution. Each line of an M-Res proof consists of a clause on existential variables and partial universal strategy functions for universal variables. These functions are represented by merge maps, which are defined as follows. For universal variable \( u \), let \( E_u \) be the set of existential variables left of \( u \) in the prefix. For line number \( i \), A non-trivial merge map \( M^u_i \) is a collection of nodes in \([i]\) along with the construction function \( M^u_i \), which details the structure. For \( j \in [i] \), the construction function \( M^u_i(j) \) is either in \([\bot, \top]\) for leaf nodes or \( E_u \times [j] \times [j] \) for internal nodes. The root \( r(u, i) \) is the highest value of all the nodes \( M^u_i \). The strategy function \( h^u_{i,a} : \{0,1\}^{E_u} \rightarrow \{0,1\} \) maps assignments of existential variables \( E_u \) in the dependency set of \( u \) to a value for \( u \). The function \( h^u_{i,a} \) for leaf nodes \( t \) is simply the truth value \( M^u_i(t) \). For internal nodes \( a \) with \( M^u_i(a) = (x, b, c) \), we should interpret \( h^u_{i,a} \) as “If \( x \) then \( h^u_{i,b} \), else \( h^u_{i,c} \)” or \( h^u_{i,a} = (x \land h^u_{i,b}) \lor (\neg x \land h^u_{i,c}) \). In summary the merge map \( M^u_i(j) \) is a representation of the strategy given by function \( h^u_{i,r(a,i)} \).
The merge resolution proof system inevitably has merge maps for the same universal variable interact, and we have two kinds of relations on pairs of merge maps.

**Definition 3.1.** Merge maps $M^u_j$ and $M^u_k$ are said to be **consistent** if $M^u_j(i) = M^u_k(i)$ for each node $i$ appearing in both $M^u_j$ and $M^u_k$.

**Definition 3.2.** Merge maps $M^u_j$ and $M^u_k$ are said to be **isomorphic** if there exists a bijection $f$ from the nodes of $M^u_j$ to the nodes of $M^u_k$ such that if $M^u_j(a) = (x, b, c)$ then $M^u_k(f(a)) = (x, f(b), f(c))$ and if $M^u_j(t) = p \in \{\bot, \top\}$ then $M^u_k(f(t)) = p$.

With two merge maps $M^u_j$ and $M^u_k$, we define two operations as follows:

- **Select**($M^u_j$, $M^u_k$) returns $M^u_j$ if $M^u_k$ is trivial (representing a “don’t care”), or $M^u_j$ and $M^u_k$ are isomorphic and returns $M^u_k$ if $M^u_j$ is trivial and not isomorphic to $M^u_k$. If neither $M^u_j$ or $M^u_k$ is trivial and the two are not isomorphic then the operation fails.

- **Merge**($x$, $M^u_j$, $M^u_k$) returns the map $M^u_i$ with $i > j, i > k$ when $M^u_j, M^u_k$ are consistent where if $a$ is a node in $M^u_j$ then $M^u_i(a) = M^u_j(a)$ and if $a$ is a node in $M^u_k$ then $M^u_i(a) = M^u_k(a)$. Merge map $M^u_i$ has a new node $r(u,i)$ as a root node (which is greater than the maximum node in each of $M^u_j(a)$ or $M^u_k(a)$), and is defined as $M^u_i(r(u,i)) = (x, r(u,j), r(u,k))$.

Proofs in M-Res consist of lines, where every line is a pair $(C_i, \{M^u_i \mid u \in U\})$. Here, $C_i$ is a purely existential clause (it contains only literals that are from existentially quantified variables). The other part is a set containing merge maps for each universal variable (some of the merge maps can be trivial, meaning they do not represent any function). Each line is derived by one of two rules:

**Axiom:** $C_i = \{l \mid l \in C, \text{var}(l) \in E\}$ is the existential subset of some clause $C$ where $C$ is a clause in the matrix. If universal literals $u, \bar{u}$ do not appear in $C$, let $M^u_i$ be trivial. If universal variable $u$ appears in $C$ then let $i$ be the sole node of $M^u_i$ with $M^u_i(i) = \bot$. Likewise if $\neg u$ appears in $C$ then let $i$ be the sole node of $M^u_i$ with $M^u_i(i) = \top$.

**Resolution:** Two lines $(C_j, \{M^u_j \mid u \in U\})$ and $(C_k, \{M^u_k \mid u \in U\})$ can be resolved to obtain a line $(C_i, \{M^u_i \mid u \in U\})$ if there is literal $\neg x \in C_j$ and $x \in C_k$ such that $C_i = C_j \cup C_k \setminus \{x, \neg x\}$, and every $M^u_i$ can either be defined as Select($M^u_j, M^u_k$), when $M^u_j$ and $M^u_k$ are isomorphic or one is trivial, or as Merge($x, M^u_j, M^u_k$) when $x < u$ and $M^u_j$ and $M^u_k$ are consistent.

### 3.2. Simulation of Merge Resolution

We now state the main result of this section.

**Theorem 3.3.** eFrege + ∀red simulates M-Res.

For a false QBF $\Pi \phi$ refuted by M-Res, the final set of merge maps represent a falsifying strategy for the universal player, the strategy can be asserted by a proposition $S$ that states that all universal variables are equivalent to their strategy circuits. It then should be the case that if $\phi$ is true, $S$ must be false, a fact that can be proved propositionally, formally $\phi \vdash \neg S$.

To build up to this proof we can inductively find a local strategy $S_i$ for each clause $C_i$ that appears in an M-Res line $(C_i, \{M^u_i\})$ such that $\phi \vdash S_i \rightarrow C_i$. Elegantly, $S_i$ is really just a circuit expressing that each $u \in U$ takes its value in $M^u_i$ (if non-trivial). Extension variables are used to represent these local strategy circuits and so the proof ends up as a propositional extended Frege proof.
The final part of the proof is the technique suggested by Chew [Che21] which was originally used by Beyersdorff et al. [BBCP20]. That is, to use universal reduction starting from the negation of a universal strategy and arrive at the empty clause.

Proof of Theorem 3.3. Definition of extension variables. We create new extension variables for each node in every non-trivial merge map appearing in a proof. $s_i^u$ is created for the node $i$ in merge map $M_i^u$. $s_i^u$ is defined as a constant when $i$ is leaf node in $M_i^u$. If $i$ is an internal node $s_i^u$ is defined as $s_i^u := (x \land s_i^u) \lor (\neg x \land s_i^u)$, when $M_i^u(i) = (x, b, c)$. Because $x$ has to be before $u$ in the prefix, $s_i^u$ is always defined before universal variable $u$.

**Induction Hypothesis:** It is easy for eFrege to prove $\bigwedge_{u \in U_i} (u \leftrightarrow s_{r(u,i)}^u) \rightarrow C_i$ from the axioms of $\phi$, where $r(u, i)$ is the index of the root node of Merge map $M_i^u$. $U_i$ is the subset of $U$ for which $M_i^u$ is non-trivial.

**Base Case: Axiom:** Suppose $C_i$ is derived by axiom download of clause $C$. If $u$ has a strategy, it is because it appears in a clause and so $u \leftrightarrow s_i^u$, where $s_i^u \leftrightarrow c_u$ for $c_u \in \top, \bot, c_u$ is correctly chosen to oppose the literal in $C$ so that $C_i$ is just the simplified clause of $C$ replacing all universal $u$ with their $c_u$. This is easy for eFrege to prove.

**Inductive Step: Resolution:** If $C_i$ is resolved with $C_k$ to get $C_j$ with pivots $\neg x \in C_j$ and $x \in C_k$, we first show $\bigwedge_{u \in U_i} (u \leftrightarrow s_{r(u,i)}^u) \rightarrow C_j$ and $\bigwedge_{u \in U_i} (u \leftrightarrow s_{r(u,i)}^u) \rightarrow C_k$, where $r(u, i)$ is the root index of the Merge map for $u$ on line $i$. We resolve these together.

To argue that $\bigwedge_{v \in V \cap U_j} (v \leftrightarrow s_{r(v,j)}^v) \rightarrow C_j$ we prove by induction that we can replace $u \leftrightarrow s_{r(u,j)}^u$ with $u \leftrightarrow s_{r(u,i)}^u$ one by one.

**Induction Hypothesis:** $U_i$ is partitioned into $W$ the set of adjusted variables and $V$ the set of variables yet to be adjusted.

$$(\bigwedge_{v \in V \cap U_j} (v \leftrightarrow s_{r(v,j)}^v)) \land (\bigwedge_{u \in U_i} (u \leftrightarrow s_{r(u,i)}^u)) \rightarrow C_j$$

**Base Case:** $(\bigwedge_{v \in V \cap U_j} (v \leftrightarrow s_{r(v,j)}^v)) \land (\bigwedge_{w \in W} (w \leftrightarrow s_{r(w,i)}^w)) \rightarrow C_j$.

**Inductive Step:** Starting with $(\bigwedge_{v \in V \cap U_j} (v \leftrightarrow s_{r(v,j)}^v)) \land (\bigwedge_{w \in W} (w \leftrightarrow s_{r(w,i)}^w)) \rightarrow C_j$. We pick a $u \in V$ to show $(u \leftrightarrow s_{r(u,i)}^u) \land (\bigwedge_{v \in V \setminus U_j} (v \leftrightarrow s_{r(v,j)}^v)) \land (\bigwedge_{w \in W} (w \leftrightarrow s_{r(w,i)}^w)) \rightarrow C_j$.

We have four cases:

1. **Select** chooses $M_i^u = M_j^u$.
2. **Select** chooses $M_i^u = M_j^u$ because $M_j^u$ is trivial.
3. **Select** chooses $M_i^u = M_j^u$ because there is an isomorphism $f$ that maps $M_j^u$ to $M_j^u$.
4. **Merge** so that $M_i^u$ is the merge of $M_j^u$ and $M_j^u$ over pivot $x$.

In (1) $(u \leftrightarrow s_{r(u,i)}^u)$ is already $(u \leftrightarrow s_{r(u,i)}^u)$ as $r(u, j) = r(u, i)$.

In (2) we are simply weakening the implication.

In (3) we prove inductively from the leaves to the root that $s_{r(t)}^u = s_{r(t)}^u$. Eventually, we end up with $s_{r(u,k)}^u = s_{r(u,i)}^u$. Then $(u \leftrightarrow s_{r(u,i)}^u)$ can be replaced by $(u \leftrightarrow s_{r(u,i)}^u)$.

As $f$ is an isomorphism $f(r(u, j)) = r(u, k)$ and because **Select** is used $r(u, k) = r(u, i)$.

Therefore we have $(u \leftrightarrow s_{r(u,i)}^u)$.

In (4) We need to replace $s_{r(u,j)}^u$ with $s_{r(u,i)}^u$. For this we use the definition of merging that $x \rightarrow (s_{r(u,i)}^u \leftrightarrow s_{r(u,i)}^u)$ and so we have $(s_{r(u,i)}^u \leftrightarrow s_{r(u,j)}^u) \lor \neg x$ but the $\neg x$ is absorbed by the $C_j$ in right hand side of the implication.

Finalise Inner Induction: At the end of this inner induction, we have \( \bigwedge_{u \in U_i} (u \leftrightarrow s^u_{r(u,i)}) \rightarrow C_j \) and symmetrically \( \bigwedge_{u \in U_i} (u \leftrightarrow s^u_{r(u,i)}) \rightarrow C_k \). We can then prove \( \bigwedge_{u \in U_i} (u \leftrightarrow s^u_{r(u,i)}) \rightarrow C_i \).

Finalise Outer Induction: Note that we have done three nested inductions on the nodes in a merge maps, on the universal variables, and then on the lines of an \( M-\text{Res} \) proof. Nonetheless, this gives a quadratic size \texttt{eFrege} proof in the number of nodes appearing in the proof. In \( M-\text{Res} \), the final line will be the empty clause and its merge maps. The induction gives us \( \bigwedge_{u \in U_i} (u \leftrightarrow s^u_{r(u,i)}) \rightarrow \bot \). In other words, if \( U_I = \{u_1, \ldots, u_n\} \), where \( u_i \) appears before \( u_{i+1} \) in the prefix, \( \bigvee_{i=1}^{n} (u_i \oplus s^u_{r(u,i)}) \).

By reduction of \( \bigvee_{i=1}^{n-k+1} (u_i \oplus s^u_{r(u,i)}) \), we derive \( (0 \oplus s^u_{r(u_{n-k+1},l)}) \lor \bigvee_{i=1}^{n-k} (u_i \oplus s^u_{r(u,i)}) \) and \( (1 \oplus s^u_{r(u_{n-k+1},l)}) \lor \bigvee_{i=1}^{n-k} (u_i \oplus s^u_{r(u,i)}) \), which we can resolve to obtain \( \bigvee_{i=1}^{n-k} (u_i \oplus s^u_{r(u,i)}) \).

We continue this until we reach the empty disjunction. \(\square\)

4. Extended \( \text{Frege} + \forall \)-Red \( p \)-simulates IR-calc

4.1. Expansion-Based Resolution Systems. The idea of an expansion based QBF proof system is to utilise the semantic identity: \( \forall u \phi(u) = \phi(0) \land \phi(1) \), to replace universal quantifiers and their variables with propositional formulas. With \( \forall u \exists x \phi(u) = \exists x \phi(0) \land \exists x \phi(1) \) the \( x \) from \( \exists x \phi(0) \) and from \( \exists x \phi(1) \) are actually different variables. The way to deal with this while maintaining prenex normal form is to introduce annotations that distinguish one \( x \) from another. We will also introduce a third annotation \( * \) which will be used only for the purpose of short proofs.

**Definition 4.1** [BCJ19].

(1) An extended assignment is a partial mapping from the universal variables to \( \{0, 1, *\} \). We denote an extended assignment by a set or list of individual replacements i.e. \( 0/u, */v \) is an extended assignment. We often use set notation where appropriate.

(2) An annotated clause is a clause where each literal is annotated by an extended assignment to universal variables.

(3) For an extended assignment \( \sigma \) to universal variables we write \( \text{restrict}_l(\sigma) \) to denote an annotated literal where \( \text{restrict}_l(\sigma) = \{c/u \in \sigma \mid |v(u) < lv(l)| \} \).

(4) Two (extended) assignments \( \tau \) and \( \mu \) are called contradictory if there exists a variable \( x \in \text{dom}(\tau) \cap \text{dom}(\mu) \) with \( \tau(x) \neq \mu(x) \).

4.1. Definitions. The most simple way to use expansion would be to expand all universal quantifiers and list every annotated clause. The first expansion based system we consider, \( \forall \text{Exp} + \text{Res} \) (Figure 2), has a mechanism to avoid this potential exponential explosion in some (but not all) cases. An annotated clause is created and then checked to see if it could be obtained from expansion. This way a refutation can just use an unsatisfiable core rather than all clauses from a fully expanded matrix.

The drawback of \( \forall \text{Exp} + \text{Res} \) is that one might end up repeating almost the same derivations over and over again if they vary only in changes in the annotation which make little difference in that part of the proof. This was used to find a lower bound to \( \forall \text{Exp} + \text{Res} \) for a family of formulas easy in system \( \text{Q-Res} \) [JM15a]. To rectify this, IR-calc improved on
\{ \text{restrict}_l(\tau) \mid l \in C, \text{ } \text{ } \text{ } l \text{ is existential} \} \cup \{ \tau(l) \mid l \in C, \text{ } \text{ } \text{ } l \text{ is universal} \} \quad \text{(Axiom)}

$C$ is a clause from the matrix and $\tau$ is a $\{0,1\}$ assignment to all universal variables.

$$C \cup \{x^\tau\} \quad \frac{C_1 \cup \{\neg x^\tau\}}{C_1 \cup C_2} \quad \text{(Res)}$$

Figure 2: The rules of $\forall\text{Exp+Res}$ (adapted from [JM15a]).

$\forall\text{Exp+Res}$ to allow a delay to the annotations in certain circumstances. Annotated clauses now have annotations with “gaps” where the value of the universal variable is yet to be set. When they are set there is the possibility of choosing both assignments without the need to rederive the annotated clauses with different annotations.

**Definition 4.2** [BCJ19]. Given two partial assignments (or partial annotations) $\alpha$ and $\beta$. The completion $\alpha \circ \beta$, is a new partial assignment, where

$$\alpha \circ \beta(u) = \begin{cases} 
\alpha(u) & \text{if } u \in \text{dom}(\alpha) \\
\beta(u) & \text{if } u \in \text{dom}(\beta) \setminus \text{dom}(\alpha) \\
\text{unassigned} & \text{otherwise}
\end{cases}$$

For $\alpha$ an assignment of the universal variables and $C$ an annotated clause we define $\text{inst}(\alpha, C) := \bigwedge\{ \text{restrict}_l(\tau \circ \alpha) \mid l \in C \}$. Annotation $\alpha$ here gives values to unset annotations where one is not already defined. Because the same $\alpha$ is used throughout the clause, the previously unset values gain consistent annotations, but mixed annotations can occur due to already existing annotations.

$$\{ \text{restrict}_l(\tau) \mid l \in C, \text{ } \text{ } \text{ } l \text{ is existential} \} \quad \text{(Axiom)}$$

$C$ is a non-tautological clause from the matrix. $\tau = \{0/u \mid u \text{ is universal in } C\}$, where the notation $0/u$ for literals $u$ is shorthand for $0/x$ if $u = x$ and $1/x$ if $u = \neg x$.

$$\frac{x^\tau \lor C_1 \quad \neg x^\tau \lor C_2}{C_1 \cup C_2} \quad \text{(Resolution)} \quad \frac{C}{\text{inst}(\tau, C)} \quad \text{(Instantiation)}$$

$\tau$ is an assignment to universal variables with $\text{rng}(\tau) \subseteq \{0,1\}$.

Figure 3: The rules of IR-calc [BCJ19].

The definition of IR-calc is given in Figure 3. Resolved variables have to match exactly, including that missing values are missing in both pivots. However, non-contradictory but different annotations may still be used for a later resolution step after the instantiation rule is used to make the annotations match the annotations of the pivot.

4.1.2. Local Strategies for $\forall\text{Exp+Res}$. The work from Schlaipfer et al. [SSWZ20] creates a conversion of each annotated clause $C$ appearing in some $\forall\text{Exp+Res}$ proof into a propositional formula $\text{con}(C)$ defined in the original variables of $\phi$ (so without creating new annotated variables). $C$ appearing in a proof asserts that there is some (not necessarily winning)
strategy for the universal player to force \( \text{con}(C) \) to be true under \( \phi \). The idea is that for each line \( C \) in an \( \forall\text{Exp+Res} \) refutation of \( \Pi \phi \) there is some local strategy \( S \) such that \( S \land \phi \rightarrow \text{con}(C) \). If \( C \) is empty, then \( S \) is a winning strategy for the universal player. Otherwise, \( S \) only wins if the existential player cooperates by playing according to one of the annotated literals \( l' \in C \), that is, if the existential player promises to falsify the literal \( l \) whenever the assignment chosen by the universal player is consistent with the annotation \( \tau \). Suda and Gleiss showed that the resolution rule can then be understood as combining strategies so that the “promises” of the existential player corresponding to the pivot literals \( x^\tau \) and \( \neg x^\tau \) cancel out [SG18].

The extra work by Schlaipfer et al. is that the strategy circuits (for each \( u \)) can be constructed in polynomial time, and can be defined in variables left of \( u_i \) in the prefix. Let \( u_1 \ldots u_n \) be all universal variables in order. For each line in an \( \forall\text{Exp+Res} \) proof we have a strategy which we will here call \( S \). For each \( u_i \) there is an extension variable \( \text{Val}^i_S \), before \( u_i \), that represents the value assigned to \( u_i \) by \( S \) (under an assignment of existential variables). Using these variables, we obtain a propositional formula representing the strategy as \( S = \bigwedge_{i=1}^n u_i \leftrightarrow \text{Val}^i_S \). Additionally, we define a conversion of annotated logic in \( \forall\text{Exp+Res} \) to propositional logic as follows. For annotations \( \tau \) let \( \text{anno}(\tau) = \bigwedge_{1/u_i \in \tau} u_i \land \bigwedge_{0/u_i \in \tau} \bar{u}_i \). We convert annotated literals as \( \text{con}(l') = l \land \text{anno}(\tau) \) and clauses as \( \text{con}(C) = \bigvee_{l \in C} \text{con}(l) \).

4.2. Policies and Simulating IR-calc. The conversion needs to be revised for IR-calc. In particular the variables not set in the annotations need to be understood. The solution is to basically treat unset as a third value, and work with local strategies that do not set all universal variables. Following Suda and Gleiss, we refer to such (partial) strategies as policies [SG18].

In practice, this requires new \( \text{Set}^i_S \) variables (left of \( u_i \)) which state that the \( i \)th universal variable is set by policy \( S \). We include these variables in our encoding of policy \( S \) and let \( S = \bigwedge_{i=1}^n \text{Set}^i_S \rightarrow (u_i \leftrightarrow \text{Val}^i_S) \). The conversion of annotations, literals and clauses also has to be changed. For annotations \( \tau \) of some quantified variable \( x \) let

\[
\text{anno}_{x,S}(\tau) = \bigwedge_{1/u_i \in \tau} (\text{Set}^i_S \land u_i) \land \bigwedge_{0/u_i \in \tau} (\text{Set}^i_S \land \bar{u}_i) \land \bigwedge_{u_i \notin \text{dom}(\tau)} \neg \text{Set}^i_S .
\]

Let \( \text{con}_S(l') = l \land \text{anno}_{x,S}(\tau) \) and \( \text{con}_S(C) = \bigvee_{l \in C} \text{con}_S(l) \) similarly to before, we just reference a particular policy \( S \). This means that we again want \( S \land \phi \rightarrow \text{con}_S(C) \) for each line, note that \( \text{Set}^i_S \) variables are defined in their own way.

The most crucial part of simulating IR-calc is that after each application of the resolution rule we can obtain a working policy.

**Lemma 4.3.** Suppose, there are policies \( L \) and \( R \) such that \( L \rightarrow \text{con}_L(C_1 \lor \neg x^\tau) \) and \( R \rightarrow \text{con}_R(C_2 \lor x^\tau) \) then there is a policy \( B \) such that \( B \rightarrow \text{con}_B(C_1 \lor C_2) \) can be obtained in a short \( \text{efReGe} \) proof.

The proof of the simulation of IR-calc relies on Lemma 4.3. To prove this we have to first give the precise definitions of the policy \( B \) based on policies \( L \) and \( R \). Schlaipfer et al.’s work [SSWZ20] is used to crucially make sure the strategy \( B \), respects the prefix ordering.
4.2.1. Building the Strategy. We start to define $\Val_B^i$ and $\Set_B^i$ on lower $i$ values first. In particular we will always start with $1 \leq i \leq m$ where $u_m$ is the rightmost universal variable still before the pivot variable $x$ in the prefix. Starting from $i = 0$, the initial segments of $\anno_{x,L}(\tau)$ and $\anno_{x,R}(\tau)$ may eventually reach such a point $j$ where one is contradicted. Before this point $L$ and $R$ are detailing the same strategy (they may differ on $\Val^i$ but only when $\Set^i$ is false) so this part of $B$ can be effectively played as both $L$ and $R$ simultaneously. Without loss of generality, as soon as $L$ contradicts $\anno_{x,L}(\tau)$, we know that $\con_L(x^\tau)$ is not satisfied by $L$ and thus it makes sense for $B$ to copy $L$, at this point and the rest of the strategy as it will satisfy $\con_B(C_1)$. It is entirely possible that we reach $i = m$ and not contradict either $\anno_{x,L}(\tau)$ or $\anno_{x,R}(\tau)$. Fortunately after this point in the game we now know the value the existential player has chosen for $x$. We can use the $x$ value to decide whether to play $B$ as $L$ (if $x$ is true) or $R$ (if $x$ is false).

To build the circuitry for $\Val_B^i$ and $\Set_B^i$ we will introduce other circuits that will act as intermediate. First we will use constants $\Set_f^i$ and $\Val_f^i$ that make $\anno_{x,S}(\tau)$ equivalent to $\bigwedge_{u_i < u_x}(\Set_f^i \leftrightarrow \Set_g^i) \land \Set_g^i \rightarrow (u_i \leftrightarrow \Val_g^i)$. This mainly makes our notation easier. Next we will define circuits that represent two strategies being equivalent up to the $i$th universal variable. This is a generalisation of what was seen in the local strategy extraction for $\forall \Exp + \Res$ [SSW20].

\[
Eq_{1=g}^0 := 1, Eq_{f=g}^i := Eq_{f=g}^{i-1}(\Set_f^i \leftrightarrow \Set_g^i) \land (\Set_f^i \rightarrow (\Val_f^i \leftrightarrow \Val_g^i)).
\]

We specifically use this for a trigger variable that tells us which one of $L$ and $R$ differed from $\tau$ first.

\[
\begin{align*}
\Diff_{L}^0 := 0 & \quad \text{and} \quad \Diff_{L}^i := \Diff_{L}^{i-1} \lor (Eq_{R=\tau}^{i-1} \land (\Set_f^i \lor (\Val_f^i \land \Val_g^i))) \\
\Diff_{R}^0 := 0 & \quad \text{and} \quad \Diff_{R}^i := \Diff_{R}^{i-1} \lor (Eq_{L=\tau}^{i-1} \land (\Set_r^i \lor (\Val_r^i \land \Val_g^i)))
\end{align*}
\]

Note that $\Diff_L^i$ and $\Diff_R^i$ can both be true but only if the strategies start to differ from $\tau$ at the same point.

Using these auxiliary variables, we can define a bottom policy $B$ that chooses between the left policy $L$ and the right policy $R$ as indicated above, following Suda and Gleiss’s `Combine` operation [SG18]. If one of the policies is inconsistent with the annotation $\tau$ (this includes setting a variable that is not set by $\tau$), policy $B$ follows whichever policy is inconsistent first, picking $L$ if both policies start deviating at the same time. If both policies are consistent with $\tau$, policy $B$ follows $R$ if the pivot $x$ is false, otherwise it follows $L$.

**Definition 4.4** (Definition of resolvent policy for $\IR$-calc). For $0 \leq i \leq m$, define $\Val_B^i$ and $\Set_B^i$ such $\Val_B^0 = \Val_R^0$ and $\Set_B^0 = \Set_R^0$ if

\[ \neg \Diff_{L}^{i-1} \land (\Diff_{R}^{i-1} \lor (\neg \Set_r^i \land \Set_l^i \land \Set_r^i) \lor (\Set_r^i \land \Set_l^i \land (\Val_r^i \leftrightarrow \Val_l^i))) \]

and $\Val_B^i = \Val_l^i$ and $\Set_B^i = \Set_l^i$, otherwise.

For $i > m$, define $\Val_B^i$ and $\Set_B^i$ such $\Val_B^i = \Val_R^i$ and $\Set_B^i = \Set_R^i$ if

\[ \neg \Diff_{L}^{m} \land (\Diff_{R}^{m} \lor \bar{x}) \]

and $\Val_B^i = \Val_l^i$ and $\Set_B^i = \Set_l^i$, otherwise.

We will now define variables $B_L$ and $B_R$. These say that $B$ is choosing $L$ or $R$, respectively. These variables can appear rightmost in the prefix, as they will be removed before reduction takes place. The purpose of $B_L$ (resp. $B_R$) is that $\con_B$ becomes the same as $\con_L$ (resp. $\con_R$).

- $B_L := \bigwedge_{i=1}^n (\Set_B^i \leftrightarrow \Set_L^i) \land (\Set_B^i \rightarrow (\Val_B^i \leftrightarrow \Val_L^i))$
\[ \text{Base Case } j = 0: \text{Dif}_0 \rightarrow \text{Dif}_0 \wedge \text{Dif}_0^{-1} \]

\[ \text{Inductive Step } j + 1: \neg \text{Dif}_L^j \lor \text{Dif}_L^j \rightarrow \text{Dif}_L^{j+1} \text{ are tautologies with a constant-size Frege proof. Putting them together we get } \text{Dif}_L^j \rightarrow \text{Dif}_L^{j+1} \wedge (\neg \text{Dif}_L^j \lor \text{Dif}_L^j) \text{ and weaken to } \text{Dif}_L^{j+1} \rightarrow (\text{Dif}_L^j \wedge \neg \text{Dif}_L^j) \lor \text{Dif}_L^j. \]

Using the induction hypothesis, \( \text{Dif}_L^j \rightarrow \bigvee_{i=1}^j \text{Dif}_L^i \wedge \neg \text{Dif}_L^{i-1} \), we can change this tautology to

\[ \text{Dif}_L^{j+1} \rightarrow (\text{Dif}_L^{j+1} \wedge \neg \text{Dif}_L^j) \lor \bigvee_{i=1}^j \text{Dif}_L^i \wedge \neg \text{Dif}_L^{i-1} \]

Note that since \( \neg \text{Dif}_R^0, \text{Eq}_{L=\tau}^0, \text{Eq}_{R=\tau}^0 \) are all true. The proofs for \( \text{Dif}_R^j, \neg \text{Eq}_{L=\tau}^j \) and \( \neg \text{Eq}_{R=\tau}^j \) are identical modulo the variable names. \( \square \)

**Lemma 4.6.** For \( 0 \leq i \leq j \leq m \) the following propositions that describe the monotonicity of Dif have short derivations in Extended Frege:

- \( \text{Dif}_L^0 \rightarrow \text{Dif}_L^j \)
- \( \text{Dif}_R^0 \rightarrow \text{Dif}_R^j \)
- \( \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^j \)

**Proof.** For \( \text{Dif}_L \) and \( \text{Dif}_R, \text{Induction Hypothesis on } j: \text{Dif}_L^j \rightarrow \text{Dif}_L^j \) has an \( O(j) \) proof.

**Base Case** \( j = i \): \( \text{Dif}_L^0 \rightarrow \text{Dif}_L^j \) is a tautology with a constant-size Frege proof.

**Inductive Step** \( j + 1 \): \( \text{Dif}_L^{j+1} := \text{Dif}_L^j \lor A \) where \( A \) is an expression. Therefore in all cases \( \text{Dif}_L^j \rightarrow \text{Dif}_L^{j+1} \) is a straightforward corollary with a constant-size number of additional Frege steps. Using the induction hypothesis \( \text{Dif}_L^j \rightarrow \text{Dif}_L^j \) we get \( \text{Dif}_L^j \rightarrow \text{Dif}_L^{j+1} \). The proof is symmetric for \( R \).

For \( \neg \text{Eq}_{f=g}^j \).

**Induction Hypothesis on } j: \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^j \) has an \( O(j) \) proof.

**Base Case** \( j = i \): \( \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^j \) is a tautology that Frege can handle.

**Inductive Step** \( j + 1 \): \( \text{Eq}_{f=g}^{j+1} := \text{Eq}_{f=g}^j \land A \) where \( A \) is an expression. Therefore in all cases \( \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^{j+1} \) is a straightforward corollary with a constant-size number of additional Frege steps. Using the induction hypothesis \( \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^{j+1} \) we can get \( \neg \text{Eq}_{f=g}^i \rightarrow \neg \text{Eq}_{f=g}^{j+1} \). \( \square \)
Lemma 4.7. For \(0 \leq i \leq j \leq m\) the following propositions describe the relationships between the different extension variables and have short derivations in Extended Frege:

- \(\text{Eq}_{L=\tau}^i \rightarrow \neg \text{Diff}_{L}^i\)
- \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1} \rightarrow \text{Eq}_{R=\tau}^i\)
- \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1} \rightarrow \neg \text{Diff}_{R}^{i-1}\)
- \(\text{Eq}_{R=\tau}^i \rightarrow \neg \text{Diff}_{R}^i\)
- \(\text{Diff}_{R}^i \land \neg \text{Diff}_{R}^{i-1} \rightarrow \text{Eq}_{L=\tau}^i\)
- \(\text{Diff}_{R}^i \land \neg \text{Diff}_{R}^{i-1} \rightarrow \neg \text{Diff}_{L}^{i-1}\)

**Proof.** **Induction Hypothesis on** \(i\): \(\text{Eq}_{L=\tau}^i \rightarrow \neg \text{Diff}_{L}^i\) in an \(O(i)\)-size Frege proof.

**Base Case** \(i = 0\): \(\text{Diff}_{L}^0\) is defined as 0 so \(\neg \text{Diff}_{L}^0\) is true and trivially implied by \(\text{Eq}_{L=\tau}^0\).

This can be shown in a constant-size Frege proof.

**Inductive Step** \(i + 1\): If \(\text{Eq}_{i+1}^i\) is false then \(\text{Eq}_{L=\tau}^{i+1}\) is equivalent to \(\text{Eq}_{L=\tau}^i \land \neg \text{Diff}_{L}^{i+1}\) and \(\neg \text{Diff}_{L}^{i+1}\) is equivalent to \(\neg \text{Diff}_{L}^i \land \neg \text{Eq}_{L=\tau}^i\). Induction hypothesis is \(\text{Eq}_{L=\tau}^i \rightarrow \neg \text{Diff}_{L}^i\), now \(\text{Eq}_{L=\tau}^{i+1}\) implies \(\neg \text{Diff}_{L}^i\) and \(\neg \text{Eq}_{L=\tau}^i\) which is enough for \(\neg \text{Diff}_{L}^{i+1}\). If \(\text{Eq}_{i+1}^i\) is true then \(\text{Eq}_{L=\tau}^{i+1}\) is equivalent to \(\text{Eq}_{L=\tau}^i \land \text{Eq}_{L=\tau}^i \land (\text{Val}_{L}^{i+1} \leftrightarrow \text{Val}_{L}^i)\) and \(\neg \text{Diff}_{L}^{i+1}\) is equivalent to \(\neg \text{Diff}_{L}^i \land \text{Eq}_{L=\tau}^i \land (\text{Val}_{L}^{i+1} \leftrightarrow \text{Val}_{L}^i) \lor \neg \text{Eq}_{L=\tau}^i\). Again, using the induction hypothesis, \(\text{Eq}_{L=\tau}^{i+1}\) now implies \(\neg \text{Diff}_{L}^i\) \(\land\) \(\text{Set}_{L}^{i+1}\) and \(\text{Val}_{L}^{i+1} \leftrightarrow \text{Val}_{L}^i\) which is enough for \(\text{Diff}_{L}^{i+1}\).

Therefore using the induction hypothesis \(\text{Eq}_{L=\tau}^{i+1} \rightarrow \neg \text{Diff}_{L}^{i+1}\). This can be shown in a constant number of Frege steps. Similarly for \(R\).

The formulas \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1} \rightarrow \text{Eq}_{R=\tau}^{i-1}\) are simple corollaries of the inductive definition of \(\text{Diff}_{L}^i\), and combined with \(\text{Eq}_{R=\tau}^{i-1}\) we get \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1} \rightarrow \neg \text{Diff}_{R}^{i-1}\). Similarly if we swap \(L\) and \(R\).

\[\square\]

Lemma 4.8. For any \(0 \leq i \leq m\) the following propositions are true and have short Extended Frege proofs.

- \(L \land \text{Diff}_{L}^i \rightarrow \neg \text{anno}_{x,L}(\tau)\)
- \(R \land \text{Diff}_{R}^i \rightarrow \neg \text{anno}_{x,R}(\tau)\)

**Proof.** We primarily use the disjunction in Lemma 4.5 \(\text{Diff}_{L}^i \rightarrow \bigvee_{i=1}^{j} \text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1}\).

Each individual disjunct \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1}\) is saying the difference triggers at that point. We can represent that in a proposition that can be proven in Extended Frege: \(\text{Diff}_{L}^i \land \neg \text{Diff}_{L}^{i-1} \rightarrow ((\text{Set}_{L}^i \land \text{Set}_{\tau}^i) \lor (\text{Set}_{L}^i \land (\text{Val}_{L}^i \land \text{Val}_{\tau}^i)))\). We want to show that this also triggers the negation of \(\text{anno}_{x,L}(\tau)\). If \(L\) differs from \(\tau\) on a \(\text{Set}_{L}^i\) value we contradict \(\text{anno}_{x,L}(\tau)\) in one of two ways: \(L \land (\text{Set}_{L}^i \land \text{Set}_{\tau}^i) \land \neg \text{Set}_{\tau}^i\) or \(L \land (\text{Set}_{L}^i \land \text{Set}_{\tau}^i) \land \neg \text{Set}_{L}^i \rightarrow \text{Set}_{\tau}^i\).

If \(L\) differs from \(\tau\) on a \(\text{Val}_{L}^i\) value when \(\text{Set}_{L}^i = 1\) we contradict \(\text{anno}_{x,L}(\tau)\) in one of two ways:

- \(L \land \text{Set}_{L}^i \land \text{Set}_{\tau}^i \land (\text{Set}_{\tau}^i \land (\text{Val}_{L}^i \land \text{Val}_{\tau}^i)) \land \neg \text{Val}_{L}^i \land u_i\)
- \(L \land \text{Set}_{L}^i \land \text{Set}_{\tau}^i \land (\text{Val}_{L}^i \land \text{Val}_{\tau}^i) \land \neg \text{Val}_{L}^i \land \text{Val}_{\tau}^i \land u_i\)

Each disjunct is a constant size Frege derivation When put together with the big disjunction this lends itself to a linear-size (in \(m\)) Frege derivation which is also symmetric for \(R\).

\[\square\]

Lemma 4.9. For any \(1 \leq j \leq m\) the following propositions are true and have a short Extended Frege proof.

- \(\neg \text{Diff}_{L}^j \land \neg \text{Diff}_{R}^j \rightarrow \text{Eq}_{L=\tau}^1\)
- \(\neg \text{Diff}_{L}^j \land \neg \text{Diff}_{R}^j \rightarrow \text{Eq}_{R=\tau}^1\)
Extended Frege proofs.

Proof. Suppose we want to prove $Dif_L^i \land \neg Dif_R^j \rightarrow (Set_B^i \leftrightarrow Set_R^j)$

• $Dif_L^i \land \neg Dif_R^j \rightarrow Set_B^i \rightarrow (Val_B^i \leftrightarrow Val_L^i)$
• $Dif_L^i \land \neg Dif_R^j \rightarrow (Set_B^i \leftrightarrow Set_R^j)$
• $Dif_L^i \land \neg Dif_R^j \rightarrow (Val_B \leftrightarrow Val_L^i)$

Proof. We first show $\neg Eq_{L=\tau}^j \rightarrow \neg Eq_{R=\tau}^{j-1} \lor Dif_L^j \lor Dif_R^j$ and $\neg Eq_{R=\tau}^{j-1} \rightarrow \neg Eq_{L=\tau}^j \lor Dif_L^j \lor Dif_R^j$. $\neg Eq_{R=\tau}^{j-1}$ and $\neg Eq_{L=\tau}^j$ are the problems here respectively, but they can be removed via induction to eventually get $\neg Dif_L^j \land \neg Dif_R^j \rightarrow Eq_{L=\tau}^j$ and $\neg Dif_L^j \land \neg Dif_R^j \rightarrow Eq_{R=\tau}^j$. The remaining implications are corollaries of these and rely on the definition of $Eq$, $Set_B$, and $Val_B$.

**Induction Hypothesis on $j$:** $\neg Dif_L^{j-1} \land \neg Dif_R^j \rightarrow Eq_{L=\tau}^j$ and $\neg Dif_L^j \land \neg Dif_R^j \rightarrow Eq_{R=\tau}^j$.

**Base Case $j = 0$:** $Eq_{L=\tau}^0$ and $Eq_{R=\tau}^0$ are both true by definition so the implications automatically hold.

**Inductive Step $j$:** $\neg Eq_{L=\tau}^{j-1} \rightarrow \neg Eq_{R=\tau}^{j-2} \lor (Set_B^i \land Val_B^i) \land (Set_R^i \land Val_R^i)$ and $(Set_B^i \land Val_B^i) \lor (Set_R^i \land Val_R^i) \rightarrow Dif_L^j \land \neg Eq_{R=\tau}^{j-1}$ so we get

$\neg Eq_{L=\tau}^{j-1} \lor Dif_L^j \land \neg Eq_{R=\tau}^{j-1} \lor Dif_R^j \land \neg Eq_{R=\tau}^{j-1}$, which using the induction hypothesis to remove $\neg Eq_{L=\tau}^j$ and $\neg Eq_{R=\tau}^{j-1}$ gives us $\neg Eq_{L=\tau}^j \rightarrow Dif_L^j \land \neg Eq_{R=\tau}^{j-1}$ which can be weakened to $\neg Eq_{L=\tau}^j \rightarrow Dif_L^j$ which is equivalent to $\neg Dif_L^j \land \neg Dif_R^j \rightarrow Eq_{L=\tau}^j$. This is done similarly when swapping $L$ and $R$.

We can obtain the remaining propositions as corollaries by using the definition of $Eq$. □

**Lemma 4.10.** For any $0 \leq i \leq m$ the following propositions are true and have short Extended Frege proofs.

• $Dif_L^i \rightarrow (Val_B^i \leftrightarrow Val_L^i) \land (Set_B^i \leftrightarrow Set_L^i)$
• $\neg Dif_L^i \land Dif_R^j \rightarrow (Val_B^i \leftrightarrow Val_L^i) \land (Set_B^i \leftrightarrow Set_R^j)$

Proof. Suppose we want to prove $Dif_L^i \rightarrow (Val_B^i \leftrightarrow Val_L^i) \land (Set_B^i \leftrightarrow Set_L^i)$. We will assume the definition

$Dif_L^i := Dif_L^{i-1} \lor (Eq_{R=\tau}^{j-1} \land (Set_B^i \land Val_B^i) \land Val_R^i))))$

and show that following proposition (that determines $B$) is falsified

$\neg Dif_L^{i-1} \land (Dif_L^{i-1} \lor (\neg Set_B^i \land Set_L^i \land Set_R^j) \lor (Set_B^i \land Set_R^j \land Val_L^i \leftrightarrow Val_B^i))))$

The first thing is that we only need to consider $Dif_L^i \land \neg Dif_L^{i-1}$ as $Dif_L^{i-1}$ already falsifies our proposition. Next we show $\neg Dif_L^{i-1}$ is forced to be true in this situation. To do this we need Lemma 4.7 for $Dif_L^i \land \neg Dif_L^{i-1} \rightarrow \neg Dif_L^{i-1}$.

Now we use $Dif_L^i \land \neg Dif_L^{i-1} \rightarrow ((Set_B^i \land Set_B^i) \land (Set_B^i \land Val_B^i \land Val_B^i))))$, we break this down into three cases

1. $Dif_L^i \land \neg Dif_L^{i-1} \land \neg Set_B^i \land Set_R^i$
2. $Dif_L^i \land \neg Dif_L^{i-1} \land Set_B^i \land \neg Set_R^i$
3. $Dif_L^i \land \neg Dif_L^{i-1} \land (Set_B^i \land Val_B^i \land Val_R^i))$

1. $Dif_L^i \land \neg Dif_L^{i-1}$ contradicts $Dif_L^{i-1}$, $Set_B^i$ contradicts $\neg Set_B^i \land Set_L^i \land Set_R^j$, and $\neg Set_B^i$ contradicts $Set_B^i \land Val_B^i \land Val_B^i))$.
2. $Dif_L^i \land \neg Dif_L^{i-1}$ contradicts $Dif_R^{i-1}$, $Set_B^i$ contradicts $\neg Set_B^i \land Set_R^j$, and $\neg Set_R^i$ contradicts $Set_B^i \land Set_L^i \land Val_L^i \leftrightarrow Val_B^i))$.

Vol. 20:1
(3) \(\text{Diff}_L^i \land \neg \text{Diff}_L^{i-1}\) contradicts \(\neg \text{Diff}_L^i\), \(\text{Set}_\tau^i\) contradicts \(\neg \text{Set}_\tau^i \land \text{Set}_L^i\) and \((\text{Val}_L^i \oplus \text{Val}_L^j)\) contradicts \((\text{Set}_\tau^i \land \text{Set}_L^i \land \neg \text{Val}_L^i)\).

Since in all cases we contradict \(\neg \text{Diff}_L^{i-1} \lor (\text{Diff}_L^i \land \neg \text{Set}_\tau^i \land \text{Set}_L^i) \lor (\text{Set}_\tau^i \land \text{Set}_L^i \land \neg \text{Val}_L^i)\)) then as per definition \((\text{Val}_B \land \text{Val}_L) = (\text{Val}_B, \text{Val}_L)\). Using \text{Diff}_L^i \rightarrow (\text{Diff}_L^i \lor \text{Diff}_L^{i-1}) \lor \text{Diff}_L^{i-1}\) we get \text{Diff}_L^i \rightarrow (\text{Val}_B \leftrightarrow \text{Val}_L) \land (\text{Set}_B \leftrightarrow \text{Set}_L^i), in a polynomial number of Frege lines.

Now we suppose we want to prove the second proposition \(\neg \text{Diff}_L^i \land \text{Diff}_R^i \rightarrow (\text{Val}_B \leftrightarrow \text{Val}_L) \land (\text{Set}_B \leftrightarrow \text{Set}_L^i).\) We need \(\neg \text{Diff}_L^i \land \text{Diff}_R^i\) to satisfy \(\neg \text{Diff}_L^{i-1} \lor (\text{Diff}_L^i \land \neg \text{Set}_\tau^i \land \text{Set}_L^i) \lor (\text{Set}_\tau^i \land \text{Set}_L^i \land \neg \text{Val}_L^i)\)) instead.

Lemma 4.6 gives us that \(\neg \text{Diff}_L^i \rightarrow \neg \text{Diff}_L^{i-1}.\) \(\text{Diff}_R^i\) is enough to satisfy the formula, so the case we need to explore is when \(\text{Diff}_R^{i-1}\) is false. We can show that \(\neg \text{Diff}_L^{i-1} \land \neg \text{Diff}_R^{i-1} \rightarrow \text{Ex}_{L,R}^{i-1}\) using Lemma 4.9. This allows us to examine just the part where \(\text{Diff}_R\) is being triggered to be true by definition: \(\neg \text{Diff}_L^i \land \neg \text{Diff}_R^{i-1} \rightarrow (\text{Set}_\tau^i \leftrightarrow \text{Set}_L^i) \land (\text{Set}_\tau^i \rightarrow (\text{Val}_B \leftrightarrow \text{Val}_L^i)).\)

Suppose the term \((\neg \text{Set}_\tau^i \land \neg \text{Set}_L^i \land \text{Set}_R^i)\) is false, assuming \(\text{Diff}_R^{i-1}\) is also false, we have to show that \((\text{Set}_\tau^i \land \text{Set}_L^i \land \neg \text{Val}_L^i)\) will be satisfied. We look at the three ways the term \((\neg \text{Set}_\tau^i \land \neg \text{Set}_L^i \land \text{Set}_R^i)\) can be falsified and show that all the parts of the remaining term must be satisfied when assuming \(\neg \text{Diff}_L^i \land \text{Diff}_R^i \land \neg \text{Diff}_R^{i-1}.)

(1) \(\text{Set}_\tau^i,\) in this case \((\text{Val}_B \leftrightarrow \text{Val}_L^i)\) is active and \(\text{Set}_L^i\) is implied by \((\text{Set}_\tau^i \leftrightarrow \text{Set}_L^i).\)

(2) \(\text{Set}_L^i,\) \(\text{Set}_\tau^i\) is implied by \((\text{Set}_\tau^i \leftrightarrow \text{Set}_L^i),\) then \((\text{Val}_B \leftrightarrow \text{Val}_L^i)\) is active.

(3) \(\neg \text{Set}_R^i,\) then using \text{Diff}_R^i and \(\neg \text{Diff}_R^{i-1}\) we must have \(\text{Set}_\tau^i\) (as this is the only allowed way \text{Diff} can trigger). Once again, \((\text{Val}_B \leftrightarrow \text{Val}_L^i)\) is active and \(\text{Set}_L^i\) is implied by \((\text{Set}_\tau^i \leftrightarrow \text{Set}_L^i).\)

Since our trigger formula is always satisfied when \(\neg \text{Diff}_L^i \land \text{Diff}_R^i \land \neg \text{Diff}_R^{i-1}\), it means that \((\text{Val}_B, \text{Set}_B^i) = (\text{Val}_L^i, \text{Set}_R^i).\) Using \text{Diff}_R^i \rightarrow (\text{Diff}_R^i \land \neg \text{Diff}_R^{i-1}) \lor \text{Diff}_R^{i-1}\) we get \(\neg \text{Diff}_L^i \land \text{Diff}_R^i \rightarrow (\text{Val}_B \leftrightarrow \text{Val}_L^i) \land (\text{Set}_B \leftrightarrow \text{Set}_R^i),\) in a polynomial number of Frege lines.

\[\Box\]

\textbf{Lemma 4.11.} The following propositions are true and have short Extended Frege proofs.

\begin{itemize}
  \item \(B \land \text{Diff}_R^m \rightarrow B_L\)
  \item \(B \land \neg \text{Diff}_L^m \land \text{Diff}_R^m \rightarrow B_R\)
\end{itemize}

\textit{Proof.} We use the disjunction \(\text{Diff}_L^m \rightarrow \lor_{j=1}^m \text{Diff}_L^j \lor \neg \text{Diff}_L^{j-1}\) from Lemma 4.5. So there is some \(j\) where this is the case. \(i\) can be looked at in cases, where \((\text{Val}_B, \text{Set}_B^i)\) is determined by Definition 4.4.

\begin{itemize}
  \item For \(1 \leq i < j\) observe that \(\text{Diff}_L^j \lor \neg \text{Diff}_L^{j-1} \rightarrow \neg \text{Diff}_L^{j-1}\). Now these negative literals propagate downwards. \(\neg \text{Diff}_L^{j-1} \land \neg \text{Diff}_L^{j-1} \rightarrow \neg \text{Diff}_L^i \land \neg \text{Diff}_L^i\) for \(0 \leq i < j\) and \(\neg \text{Diff}_L^i \land \neg \text{Diff}_L^i\) means that \(B\) and \(L\) are consistent for those \(i\) as proven in Lemma 4.9.
  \item For \(j \leq i \leq m, \text{Diff}_L^j \rightarrow \text{Diff}_L^i\) and \(\text{Diff}_L^i\) means \(B\) and \(L\) are consistent on those \(i\) as proven in Lemma 4.10.
  \item For indices greater than \(m, B \land \text{Diff}_R^m\) falsifies \(\neg \text{Diff}_L^m \land (\text{Diff}_R^m \lor \bar{x})\), so \(B\) and \(L\) are consistent on those indices.
\end{itemize}

With the second proposition \(\text{Diff}_R^m \rightarrow \lor_{j=1}^m \text{Diff}_R^j \lor \neg \text{Diff}_R^{j-1}\) once again. So there is some \(j\) where this is the case. Note that \(\neg \text{Diff}_L^m \rightarrow \neg \text{Diff}_L^i\) for \(i \leq m\).

\begin{itemize}
  \item For \(1 \leq i < j\), both \(\neg \text{Diff}_L^i\) and \(\neg \text{Diff}_R^i\) occur so then \(B\) and \(R\) are consistent for these values.
\end{itemize}
For \( j \leq i \leq m \), \( \text{Diff}_R^j \rightarrow \text{Diff}_R^i \) and \( \text{Diff}_R^i \land \neg \text{Diff}_L^i \) means \( B \) and \( R \) are consistent on those \( i \) as proven in Lemma 4.10.

For indices greater than \( m \), \( B \land \neg \text{Diff}_R^m \land \neg \text{Diff}_L^m \) satisfies \( \neg \text{Diff}_L^m \land (\text{Diff}_R^m \lor \bar{x}) \), so \( B \) and \( R \) are consistent on those indices.

Each of these use a polynomial number of Frege steps and uses of previous lemmas (each of which consist of a polynomial number of Frege steps).

\[ \square \]

**Lemma 4.12.** The following propositions are true and have short Extended Frege proofs.

- \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \rightarrow B_L \lor \neg x \)
- \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \rightarrow B_R \lor x \)

**Proof.** For indices \( 1 \leq i \leq m \), since \( \neg \text{Diff}_L^m \rightarrow \neg \text{Diff}_L^i \) and \( \neg \text{Diff}_R^m \rightarrow \neg \text{Diff}_R^i \), Lemma 4.9 can be used to show that \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \) leads to \( \text{Set}_B^i = \text{Set}_L^i = \text{Set}_R^i \) and \( \text{Val}_B^i = \text{Val}_L^i = \text{Val}_R^i \) whenever \( \text{Set}_B^i \) is also true. Extended Frege can prove the \( O(m) \) propositions that show these equalities for \( 1 \leq i \leq m \).

For \( i > m \), by definition \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \land x \) gives \( \text{Set}_B^i = \text{Set}_L^i \) and \( \text{Val}_B^i = \text{Val}_L^i \). And \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \land \neg x \) gives \( \text{Set}_B^i = \text{Set}_R^i \) and \( \text{Val}_B^i = \text{Val}_R^i \). The sum of this is that \( B \land \text{Diff}_L^m \land \text{Diff}_R^m \land x \rightarrow B_L \) and \( B \land \text{Diff}_L^m \land \text{Diff}_R^m \land \neg x \rightarrow B_R \). \( \square \)

**Lemma 4.13.** The following proposition is true and has a short Extended Frege proof.

\[ B \rightarrow B_L \lor B_R \]

**Proof.** This roughly says that \( B \) either is played entirely as \( L \) or is played as \( R \). We can prove this by combining Lemmas 4.11 and 4.12, it essentially is a case analysis in formal form.

\[ \square \]

**Lemma 4.14.** The following propositions are true and have short Extended Frege proofs.

- \( B \land \text{anno}_{x,B}(\tau) \land x \rightarrow B_L \)
- \( B \land \text{anno}_{x,B}(\tau) \land \neg x \rightarrow B_R \)

**Proof.** We start with \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \rightarrow B_L \lor \neg x \) and \( B \land \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \rightarrow B_R \lor x \). It remains to remove \( \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \) from the left hand side. This is where we use \( L \land \text{Diff}_L^m \rightarrow \neg \text{anno}_{x,L}(\tau) \) and \( R \land \text{Diff}_R^m \rightarrow \neg \text{anno}_{x,R}(\tau) \) from Lemma 4.8. These can be simplified to \( B \land B_L \land \text{Diff}_L^m \rightarrow \neg \text{anno}_{x,B}(\tau) \) and \( B \land B_R \land \text{Diff}_R^m \rightarrow \neg \text{anno}_{x,B}(\tau) \). The \( B_L \) and \( B_R \) can be removed by using \( B \land \text{Diff}_L^m \rightarrow B_L \) and \( B \land \neg \text{Diff}_L^m \land \text{Diff}_R^m \rightarrow B_R \) and we can end up with \( B \rightarrow \neg \text{anno}_{x,B}(\tau) \lor (\neg \text{Diff}_L^m \land \neg \text{Diff}_R^m) \). We can use this to resolve out \( \neg \text{Diff}_L^m \land \neg \text{Diff}_R^m \) and get \( B \land \text{anno}_{x,B}(\tau) \land x \rightarrow B_L \) and \( B \land \text{anno}_{x,B}(\tau) \land \neg x \rightarrow B_R \). \( \square \)

**Proof of Lemma 4.3.** Since \( B \land B_L \rightarrow L \) and \( B \land B_R \rightarrow R \) and \( L \rightarrow \text{con}_L(C_1 \lor \neg x^*) \) and \( R \rightarrow \text{con}_R(C_2 \lor x^*) \) imply \( B \land B_L \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \), \( B \land B_R \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \), \( B \land B_L \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg \text{anno}_{x,B}(\tau) \), and \( B \land B_R \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \). Next, we aim to derive \( B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg \text{anno}_{x,B}(\tau) \).

We combine \( B \rightarrow B_L \lor B_R \) with \( B \land B_L \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \) (removing \( B_L \)) and \( B \land B_R \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \) (removing \( B_R \)) to gain \( B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau) \). Next, we aim to derive \( B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg \text{anno}_{x,B}(\tau) \). Policy \( B \) is set up so that \( B \land \text{anno}_{x,B}(\tau) \land x \rightarrow B_L \) and \( B \land \text{anno}_{x,B}(\tau) \land \neg x \rightarrow B_R \) have short proofs (Lemma 4.14). We resolve these, respectively, with \( B \land B_R \rightarrow \text{con}_B(C_1 \lor C_2) \lor x \) (on \( x \)) to obtain \( B \land \text{anno}_{x,B}(\tau) \land B_R \rightarrow B_L \lor \text{con}_B(C_1 \lor C_2) \), and with \( B \land B_L \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg x \) (on \( \neg x \)) to obtain \( B \land \text{anno}_{x,B}(\tau) \land B_L \rightarrow B_R \lor \text{con}_B(C_1 \lor C_2) \). Putting these together allows us to remove \( B_L \) and \( B_R \), deriving \( B \land \text{anno}_{x,B}(\tau) \rightarrow \text{con}_B(C_1 \lor C_2) \), which can be rewritten as \( B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg \text{anno}_{x,B}(\tau) \).
We now have two formulas $B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \neg \text{anno}_{x,B}(\tau)$ and $B \rightarrow \text{con}_B(C_1 \lor C_2) \lor \text{anno}_{x,B}(\tau)$, which resolve to get $B \rightarrow \text{con}_B(C_1 \lor C_2)$.

**Theorem 4.15.** $\text{eFrege} + \forall \text{red}$ $p$-simulates $\text{IR-calc}$.

**Proof.** We prove by induction that every annotated clause $C$ appearing in an $\text{IR-calc}$ proof has a local policy $S$ such that $\phi \vdash_{\text{eFrege}} S \rightarrow \text{con}_S(C)$ and this can be done in a polynomial-size proof.

**Axiom:** Suppose $C \in \phi$ and $D = \text{inst}(C, \tau)$ for partial annotation $\tau$. We construct policy $B$ such that $B \rightarrow \text{con}_B(D)$ can be derived from $C$.

$$\text{Set}_B^j = \begin{cases} 1 & \text{if } u_j \in \text{dom}(\tau) \\ 0 & \text{if } 0/u_j \in \tau \\ 0 & \text{if } 0/u_j \in \tau \end{cases}, \quad \text{Val}_B^j = \begin{cases} 1 & \text{if } 1/u_j \in \tau \\ 0 & \text{if } 0/u_j \in \tau \end{cases}$$

**Instantiation:** Suppose we have an instantiation step for $C$ on a single universal variable $u_i$ using instantiation $0/u_i$, so the new annotated clause is $D = \text{inst}(C,0/u_i)$. From the induction hypothesis $T \rightarrow \text{con}_T(C)$ we will develop $B$ such that $B \rightarrow \text{con}_B(D)$.

$$\text{Set}_T^j = \begin{cases} 1 & \text{if } j = i \\ \text{Set}_T^j & \text{if } j \neq i \end{cases}, \quad \text{Val}_B^j = \begin{cases} \text{Val}_B^j \land \text{Set}_T^j & \text{if } j = i \\ \text{Val}_T & \text{if } j \neq i \end{cases}$$

$\text{Val}_T^j \land \text{Set}_T^j$ becomes $\text{Val}_T^j \lor \neg \text{Set}_T^j$ for instantiation by $1/u_j$. Either case means $B$ satisfies the matching annotations anno as $T$ appearing in our converted clauses $\text{con}_B(C)$ and $\text{con}_B(D)$, proving the rule as an inductive step.

**Resolution:** See Lemma 4.3.

**Contradiction:** At the end of the proof we have $T \rightarrow \text{con}_T(\bot)$. $T$ is a policy, so we turn it into a full strategy $B$ by having for each $i$: $\text{Val}_B^i = (\text{Val}_T^i \land \text{Set}_T^i)$ and $\text{Set}_B^i = 1$. Effectively this instantiates $\bot$ by the assignment that sets everything to 0 and we can argue that $B \rightarrow \text{con}_B(\bot)$ although $\text{con}_B(\bot)$ is just the empty clause. So we have $\neg B$. But $\neg B$ is just $\bigvee_{i=1}^n (u_i \oplus \text{Val}_B^i)$. Furthermore, just as in Schlaipfer et al.’s work [SSWZ20], we have been careful with the definitions of the extension variables $\text{Val}_B^i$ so that they are left of $u_i$ in the prefix. In $\text{eFrege} + \forall \text{red}$ we can use the reduction rule (this is the first time we use the reduction rule). We show an inductive proof of $\bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$ for increasing $k$ eventually leaving us with the empty clause. This essentially is where we use the $\forall$-Red rule. Since we already have $\bigvee_{i=1}^n (u_i \oplus \text{Val}_B^i)$ we have the base case and we only need to show the inductive step.

We derive from $\bigvee_{i=1}^{n+1-k} (u_i \oplus \text{Val}_B^i)$ both $0 \oplus \text{Val}_B^{n-k+1} \lor \bigvee_{i=1}^n (u_i \oplus \text{Val}_B^i)$ and $(1 \oplus \text{Val}_B^{n-k+1}) \lor \bigvee_{i=1}^n (u_i \oplus \text{Val}_B^i)$ from reduction. We can resolve both to derive $\bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$.

We continue this until we reach the empty disjunction.

**Corollary 4.16.** $\text{eFrege} + \forall \text{red}$ $p$-simulates $\forall \text{Exp+Res}$.

While this can be proven as a corollary of the simulation of $\text{IR-calc}$, a more direct simulation can be achieved by defining the resolvent strategy by removing the $\text{Set}^i$ variables (i.e. by considering them as always true).
5. Extended Frege+$\forall$-Red p-simulates IRM-calc

5.1. IRM-calc. IRM-calc was designed to compress annotated literals in clauses in order to simulate LD-Q-Res [BCJ14]. Like that system it uses the * symbol, but since universal literals do not appear in an annotated clause, the * value is added to the annotations, 0/u, 1/u, */u being the first three possibilities in an extended annotation (we can consider the fourth to be when u does not appear in the annotation).

5.1.1. IRM-calc. IRM-calc was designed to compress annotated literals in clauses in order to simulate LD-Q-Res [BCJ14]. Like that system it uses the * symbol, but since universal literals do not appear in an annotated clause, the * value is added to the annotations, 0/u, 1/u, */u being the first three possibilities in an extended annotation (we can consider the fourth to be when u does not appear in the annotation).

Axiom and instantiation rules as in IR-calc in Figure 3.

\[
\begin{align*}
\frac{x^{\tau \cup \xi} \lor C_1}{\text{inst}(\sigma, C_1)} & \quad \frac{-x^{\tau \cup \sigma} \lor C_2}{\text{inst}(\xi, C_2)} \quad \text{(Resolution)} \\
\end{align*}
\]

\[
\text{dom}(\tau), \text{dom}(\xi) \text{ and } \text{dom}(\sigma) \text{ are mutually disjoint.}
\]

\[
\tau \text{ is a partial assignment to the universal variables with } \text{codomain}(\tau) = \{0, 1\}.
\]

\[
\sigma \text{ and } \xi \text{ are extended partial assignments with } \text{codomain}(\sigma) = \text{codomain}(\xi) = \{0, 1, *\}.
\]

\[
\frac{C \lor b^\mu \lor b^\sigma}{C \lor b^\xi} \quad \text{(Merging)}
\]

\[
\text{dom}(\mu) = \text{dom}(\sigma). \quad \xi = \{c/u \mid c/u \in \mu, c/u \in \sigma\} \cup \{*/u \mid c/u \in \mu, d/u \in \sigma, c \neq d\}.
\]

Figure 4: The rules of IRM-calc [BCJ19].

The rules of IRM-calc as given in Figure 4, become more complicated as a result of the */u annotations. In particular resolution is no longer done between matching pivots but matching is done internally in the resolution steps. */u annotations are meant to represent ambiguous annotations so it could mean a pair of pivots literals that each have a */u annotation do not actually match on u. The solution to this is to allow compatibility where one pivot has a */u annotation where the other has no annotation in u. The idea is that the blank annotation is instantiated on-the-fly with the correct function for */u so that the annotations truly match. The resolvent takes this into account by joining the instantiated clauses minus the pivot.

Additionally in order to introduce * annotations a merge rule is used.

It is in IRM-calc where the positive Set literals introduced in the simulation of IR-calc become useful. In most ways Set\textsubscript{i}S asserts the same things as */u\textsubscript{i}, that u\textsubscript{i} is given a value, but this value does not have to be specified.

5.2. Policies and Simulating IRM-calc.

5.2.1. Conversion. The first major change from IR-calc is that while anno\textsubscript{S} worked on three values in IR-calc, in IRM-calc we effectively run in four values Set\textsubscript{i}S, ¬Set\textsubscript{i}S, Set\textsubscript{i}S \land u\textsubscript{i} and Set\textsubscript{i}S \land ¬u\textsubscript{i}. Set\textsubscript{i}S is the new addition deliberately ambiguous as to whether u\textsubscript{i} is true or false. Readers familiar with the * used in IRM-calc may notice why Set\textsubscript{i}S works as a conversion of */u\textsubscript{i}, as Set\textsubscript{i}S is just saying our policy has given a value but it may be different values in different circumstances.

\[
\text{anno}_{x,S}(\tau) = \bigwedge_{1/u_i \in \tau}(\text{Set}_{x,S} \land u_i) \land \bigwedge_{0/u_i \in \tau}(\text{Set}_{x,S} \land \bar{u}_i) \land \bigwedge_{*/u_i \in \tau}(\text{Set}_{x,S}) \land \bigwedge_{u_i \notin \text{dom}(\tau)}(\neg\text{Set}_{x,S}).
\]

\[
\text{con}_{S}(x^\tau) = x \land \text{anno}_{x,S}(\tau), \quad \text{con}_{S}(C_1) = \bigvee_{x^\tau \in C_1} \text{con}(x^\tau)
\]
5.2.2. **Policies.** Like in the case of IR-cal, most work needs to be done in the IRM-cal resolution steps, although here it is even more complicated. A resolution step in IRM-cal is in two parts. Firstly $C_1 \lor \neg x^{\tau \land i} \land \neg x^{\tau \land j}$ are both instantiated (but by * in some cases), secondly they are resolved on a matching pivot. We simplify the resolution steps so that $\sigma$ and $\xi$ only contain * annotations, for the other constant annotations that would normally be found in these steps suppose we have already instantiated them in the other side so that they now appear in $\tau$ (this does not affect the resolvent).

Again we assume that there are policies $L$ and $R$ such that $L \rightarrow \text{con}_L(C_1 \lor \neg x^{\tau \land i})$ and $R \rightarrow \text{con}_R(C_2 \lor x^{\tau \land j})$. We know that if $R$ falsifies $\text{anno}_x(L(\tau \lor i))$ then $\text{con}_L(C_1)$ and likewise if $R$ falsifies $\text{anno}_x(R(\tau \lor j))$ then $\text{con}_R(C_2)$ is satisfied. These are the safest options, however this leaves cases when $L$ satisfies $\text{anno}_x(L(\tau \lor i))$ and $R$ satisfies $\text{anno}_x(R(\tau \lor j))$ but $L$ and $R$ are not equal. This happens either when $\text{Set}_L^i$ and $\neg \text{Set}_R^i$ both occur for $\forall u_i \in \sigma$ or when $\neg \text{Set}_L^i$ and $\text{Set}_R^i$ both occur for $\forall u_i \in \xi$.

This would cause an issue if $B$ had to choose between $L$ and $R$ to satisfy $\text{con}_B(C_1 \lor C_2)$, as previously in IR-cal we would be able to be agreeable to both $L$ and $R$ and defer our choice later down the prefix (which could be necessary). Fortunately, we are not trying to satisfy $\text{con}_B(C_1 \lor C_2)$ but $\text{con}_B(\text{inst}(\xi, C_1) \lor \text{inst}(\sigma, C_2))$, so we have to choose between a policy that will satisfy $\text{con}_B(\text{inst}(\xi, C_1))$ and a policy that will satisfy $\text{con}_B(\text{inst}(\sigma, C_2))$. This is similar to doing the internal instantiation steps separately from the resolution steps, but the instantiation step need a slight bit more care as they instantiate by functions rather than constants. What this looks like is that in addition to $L$ we will occasionally borrow values from $R$ and vice versa. By borrowing values from the opposite policy we obtain a working new policy that does not have to choose between left and right any earlier than we would have for IR-cal.

5.2.3. **Difference and Equivalence Variables.** We update our functions to take into account the 4 values. Note here again we assume $\sigma$ and $\xi$ only contain * annotations.

$$\text{Eq}_{f=g}^0 := 1$$

$$\text{Eq}_{f=g}^i := \text{Eq}_{f=g}^{i-1} \land (\text{Set}_f^i \leftrightarrow \text{Set}_g^i) \land (\text{Set}_f^i \rightarrow (\text{Val}_f^i \leftrightarrow \text{Val}_g^i))$$

when $\forall u_i \notin g$

$$\text{Eq}_{f=g}^i := \text{Eq}_{f=g}^{i-1} \land \text{Set}_f^i$$

when $\forall u_i \in g$

$$\text{Dif}_L^i := 0 \land \text{Dif}_R^i := 0$$

For $u_i \notin \text{dom}(\tau \lor \sigma \lor \xi)$,

$$\text{Dif}_L^i := \text{Dif}_L^{i-1} \lor (\text{Eq}_{R=\tau \lor \xi}^{i-1} \land \text{Set}_L^i)$$

For $u_i \in \text{dom}(\tau)$,

$$\text{Dif}_L^i := \text{Dif}_L^{i-1} \lor (\text{Eq}_{R=\tau \lor \xi}^{i-1} \land \text{Set}_R^i)$$

For $u_i \in \text{dom}(\sigma)$,

$$\text{Dif}_L^i := \text{Dif}_L^{i-1} \lor (\text{Eq}_{R=\tau \lor \xi}^{i-1} \land \neg \text{Set}_L^i)$$

For $u_i \in \text{dom}(\xi)$,

$$\text{Dif}_L^i := \text{Dif}_L^{i-1} \lor (\text{Eq}_{R=\tau \lor \xi}^{i-1} \land \neg \text{Set}_R^i)$$

5.2.4. **Policy Variables.** We define the policy variables $\text{Val}_B^i$ and $\text{Set}_B^i$ based on a number of cases, in all cases $\text{Val}_B^i$ and $\text{Set}_B^i$ are defined on variables left of $u_i$.

For $u_i \notin \text{dom}(\tau \lor \sigma \lor \xi)$, $u_i < x$,

$$(\text{Val}_B^i, \text{Set}_B^i) = \begin{cases} (\text{Val}_R^i, \text{Set}_R^i) & \text{if } \neg \text{Dif}_L^{i-1} \land (\text{Dif}_R^{i-1} \lor \neg \text{Set}_L^i) \\ (\text{Val}_L^i, \text{Set}_L^i) & \text{otherwise}. \end{cases}$$

For $u_i \in \text{dom}(\tau)$,

$$(\text{Val}_B^i, \text{Set}_B^i) = \begin{cases} (\text{Val}_R^i, \text{Set}_R^i) & \text{if } \neg \text{Dif}_L^{i-1} \land (\text{Dif}_R^{i-1} \lor (\text{Val}_L^i \leftrightarrow \text{Val}_R^i)) \\ (\text{Val}_L^i, \text{Set}_L^i) & \text{otherwise}. \end{cases}$$

$$(\text{Val}_B^i, \text{Set}_B^i) = \begin{cases} (\text{Val}_B^i, \text{Set}_B^i) & \text{if } \neg \text{Dif}_L^{i-1} \land (\text{Dif}_R^{i-1} \lor (\text{Val}_B^i \leftrightarrow \text{Val}_R^i)) \\ (\text{Val}_B^i, \text{Set}_B^i) & \text{otherwise}. \end{cases}$$
For \(*/u_i \in \sigma\),

\[
(\text{Val}_B, \text{Set}_B) = \begin{cases}
(0, 1) & \text{if } \neg \text{Dif}^{i-1}_L \land \text{Dif}^{i-1}_R \land \neg \text{Set}_R^i \\
(\text{Val}_R^i, \text{Set}_R^i) & \text{if } \neg \text{Dif}^{i-1}_L \land \text{Set}_R^i \land (\text{Dif}^{i-1}_R \lor \text{Set}_L^i) \\
(\text{Val}_L^i, \text{Set}_L^i) & \text{otherwise.}
\end{cases}
\]

For \(*/u_i \notin \xi\),

\[
(\text{Val}_B, \text{Set}_B) = \begin{cases}
(0, 1) & \text{if } \text{Dif}^{i-1}_L \land \neg \text{Set}_L^i \\
(\text{Val}_R^i, \text{Set}_R^i) & \text{if } \neg \text{Dif}^{i-1}_L \land (\text{Dif}^{i-1}_R \lor \neg \text{Set}_L^i) \\
(\text{Val}_L^i, \text{Set}_L^i) & \text{otherwise.}
\end{cases}
\]

For \(u_i > x\),

\[
(\text{Val}_B, \text{Set}_B) = \begin{cases}
(\text{Val}_R^i, \text{Set}_R^i) & \text{if } \neg \text{Dif}^m_L \land (\text{Dif}^m_R \lor \neg x) \\
(\text{Val}_L^i, \text{Set}_L^i) & \text{otherwise.}
\end{cases}
\]

The idea for the policy \(B\) is to stick to \(\tau \sqcup \sigma \sqcup \xi\) until either \(L\) or \(R\) differ, then commit to whichever strategy that is differing (and default to \(L\) when both start to differ at the same time). However there are cases where a \(\text{Set}_L\) or \(\text{Set}_R\) value may differ from \(\tau \sqcup \sigma \sqcup \xi\) but it should not be counted as a true difference for \(L\) or \(R\). An example is when \(*/u_i \in \sigma\) and \(\text{Set}_R\) is false, we should not commit to \(R\) here, but instead borrow the set and value pair from \(L\) for this case. Once we commit to \(L\) or \(R\) we may still have make sure \(B\) satisfies the instantiated resolvent so a few cases where we have force \(\text{Set}_B\) to be true and we set \(\text{Val}_B\) to be false. Finally if no difference is found along \(\tau \sqcup \sigma \sqcup \xi\) we surely have to commit to either \(L\) or \(R\) depending on the value of the existential literal \(x\).

5.3. **Proof in eFrege + \forall\text{red}**.

**Lemma 5.1.** For \(0 < j \leq m\) the following propositions have short derivations in Extended Frege:

\(\bullet\) \(\text{Dif}_i^j \rightarrow \bigvee_{i=1} \text{Dif}_i^j \land \neg \text{Dif}_i^{j-1}\)

\(\bullet\) \(\text{Dif}_R^j \rightarrow \bigvee_{i=1} \text{Dif}_R^j \land \neg \text{Dif}_R^{j-1}\)

\(\bullet\) \(\neg \text{Eq}_{L=\tau \cup \sigma} \rightarrow \bigvee_{i=1} \neg \text{Eq}_{L=\tau \cup \sigma} \land \text{Eq}_L^{i=1}\)

\(\bullet\) \(\neg \text{Eq}_{R=\tau \cup \xi} \rightarrow \bigvee_{i=1} \neg \text{Eq}_{R=\tau \cup \xi} \land \text{Eq}_R^{i=1}\)

**Proof.** The proof of Lemma 4.5 still works despite the modifications to definition.

**Lemma 5.2.** For \(0 \leq i \leq j \leq m\) the following propositions that describe the monotonicity of \(\text{Dif}\) and \(\text{Eq}\) have short derivations in Extended Frege:

\(\bullet\) \(\text{Dif}_i^L \rightarrow \text{Dif}_i^L\)

\(\bullet\) \(\text{Dif}_R^i \rightarrow \text{Dif}_R^j\)

\(\bullet\) \(\neg \text{Eq}_{f=g} \rightarrow \neg \text{Eq}_{f=g}\)

**Proof.** The proofs of Lemma 4.6 still work despite the modifications to definition.

**Lemma 5.3.** For \(0 \leq i \leq j \leq m\) the following propositions describe the relationships between the different extension variables

\(\bullet\) \(\text{Eq}_{L=\tau \cup \sigma} \rightarrow \neg \text{Dif}_i^L\)

\(\bullet\) \(\text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \text{Eq}_{L=\tau \cup \xi}^{i=1}\)

\(\bullet\) \(\text{Dif}_L^i \land \neg \text{Dif}_{L}^{j-1} \rightarrow \neg \text{Dif}_R^{i-1}\)

\(\bullet\) \(\text{Eq}_{R=\tau \cup \xi} \rightarrow \neg \text{Dif}_R^R\)

**Proof.**
\[ \text{Proof. Induction Hypothesis on } i: \text{ Eq}_L^{i-1} \rightarrow \neg \text{Diff}_L^{i-1} \text{ in an O(i)-size } e\text{Frege proof.} \]

**Base Case** \( i = 0 \): \( \text{Diff}_L^0 \) is defined as 0 so \( \neg \text{Diff}_L^0 \) is true and trivially implied by \( \text{Eq}_L^0 \). Frege can manage this.

**Inductive Step** \( i + 1 \): This breaks into cases depending on the domains of \( u_{i+1} \). If \( u_{i+1} \notin \text{dom}(\tau) \), \( \text{Eq}_L^{= \tau \cup x} := \text{Eq}_L^{= \tau \cup x} \wedge (\text{Set}_L^{i+1} \leftrightarrow \text{Val}_L^{i+1}) \wedge (\text{Set}_L^{i+1} \rightarrow (\text{Val}_L^{i+1} \leftrightarrow \text{Val}_L^{i+1})) \) furthers if \( u_{i+1} \notin \text{dom}(\tau \cup \sigma) \) then \( \text{Diff}_L^{i+1} := \text{Diff}_L^i \vee (\text{Eq}_L^{= \tau \cup x} \wedge \text{Set}_L^{i+1}) \). Note that here \( \text{Set}_L^{i+1} \) is defined as 0 so \( \text{Eq}_L^{= \tau \cup x} \rightarrow (\text{Eq}_L^{= \tau \cup x} \wedge \neg \text{Set}_L^{i+1}) \). Adding the induction hypothesis gives \( \text{Eq}_L^{i+1} \rightarrow \neg \text{Diff}_L^i \wedge \neg \text{Set}_L^{i+1} \). Note that because \( \neg \text{Diff}_L^i \wedge \neg \text{Set}_L^{i+1} \) directly refutes \( \text{Diff}_L^i \wedge \neg \text{Set}_L^{i+1} \) we get \( \text{Eq}_L^{i+1} \rightarrow \neg \text{Diff}_L^{i-1} \). Now if \( u_{i+1} \notin \text{dom}(\tau) \) then

\[
\text{Diff}_L^{i+1} := \text{Diff}_L^{i-1} \vee (\text{Eq}_L^{= \tau \cup x} \wedge (\neg \text{Set}_L^i \wedge (\text{Val}_L^i \oplus \text{Val}_L^i)))
\]

Now \( \text{Set}_L^{i+1} \) is defined as 1. If \( 1/u_{i+1} \in \tau \), \( \text{Val}_L^{i+1} := 1 \) so \( \text{Diff}_L^{i+1} := \text{Diff}_L^i \vee (\text{Eq}_L^{= \tau \cup x} \wedge (\neg \text{Set}_L^i \wedge \text{Val}_L^i)) \) and \( \text{Eq}_L^{= \tau \cup x} \rightarrow (\text{Eq}_L^{= \tau \cup x} \wedge \text{Val}_L^i) \). Adding the induction hypothesis gives \( \text{Eq}_L^{i+1} \rightarrow \neg \text{Diff}_L^i \wedge \text{Val}_L^i \). But \( \neg \text{Diff}_L^i \wedge \text{Val}_L^i \) falsifies \( \text{Diff}_L^i \vee (\text{Eq}_L^{= \tau \cup x} \wedge (\neg \text{Set}_L^i \wedge (\text{Val}_L^i)))) \). So \( \text{Diff}_L^{i+1} \rightarrow \neg \text{Diff}_L^{i+1} \). This works similarly if \( 0/u_{i+1} \in \tau \). If \( u_{i+1} \in \text{dom}(\tau) \), \( \text{Eq}_L^{= \tau \cup x} := \text{Eq}_L^{= \tau \cup x} \wedge \text{Set}_L^{i+1} \) and \( \text{Diff}_L^{i+1} := \text{Diff}_L^i \vee (\text{Eq}_L^{= \tau \cup x} \wedge \neg \text{Set}_L^{i+1}) \). But adding from the induction hypothesis we can have \( \text{Eq}_L^{i+1} \rightarrow \neg \text{Diff}_L^i \wedge \text{Set}_L^{i+1} \) and \( \neg \text{Diff}_L^i \wedge \text{Set}_L^{i+1} \) directly contradicts \( \text{Diff}_L^i \vee (\text{Eq}_L^{= \tau \cup x} \wedge \neg \text{Set}_L^{i+1}) \) so then \( \text{Eq}_L^{i+1} \rightarrow \neg \text{Diff}_L^{i-1} \). Each case requires a constant number of Frege steps.

In every case \( \text{Diff}_L^{i+1} = \text{Diff}_L^{i+1} \vee (\text{Eq}_L^{= \tau \cup x} \wedge A) \) where \( A \) is a formula dependent on the domain of \( u_i \). \( \neg \text{Diff}_L^i \wedge \text{Diff}_L^i \) means that \( \text{Eq}_L^{= \tau \cup x} \) must be true. So we have \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \text{Eq}_L^{= \tau \cup x} \) in a constant size \( e\text{Frege proof} \).

If we combine the above we have a linear size proof of \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \text{Diff}_L^{i+1} \). The same proofs symmetrically work for \( R \).

**Lemma 5.4.** For any \( 0 \leq i \leq m \) the following propositions are true and have short Extended Frege proofs.

- \( L \wedge \text{Diff}_L^i \rightarrow \neg \text{anno}_{x,R}(\tau \cup x) \)
- \( R \wedge \text{Diff}_R^i \rightarrow \neg \text{anno}_{x,R}(\tau \cup x) \)

**Proof.** If \( u_i \notin \text{dom}(\tau \cup x) \), then \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \text{Set}_L^i \) is a simple corollary of the definition line \( \text{Diff}_L^i \leftrightarrow \text{Diff}_L^{i-1} \vee (\text{Eq}_L^{= \tau \cup x} \wedge \text{Set}_L^i) \). But as \( \text{anno}_{x,L}(\tau \cup x) \) insists on \( \neg \text{Set}_L^i \), we can get \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \neg \text{anno}_{x,L}(\tau \cup x) \).

If \( 1/u_i \in \tau \), then \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \neg \text{Set}_L^i \vee \text{Val}_L^i \) is a simple corollary of the definition lines \( \text{Diff}_L^i \leftrightarrow \text{Diff}_L^{i-1} \vee (\text{Eq}_L^{= \tau \cup x} \wedge (\neg \text{Set}_L^i \vee (\text{Set}_L^i \wedge (\text{Val}_L^i \oplus \text{Val}_L^i)))) \), \( \text{Set}_L^i \) and \( \text{Val}_L^i \). But as \( \text{anno}_{x,L}(\tau \cup x) \) insists on \( \text{Set}_L^i \wedge u_i \), and \( L \) insists on \( \text{Val}_L^i \leftrightarrow u_i \) we get \( L \wedge \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \neg \text{anno}_{x,L}(\tau \cup x) \).

Similarly, if \( 0/u_i \in \tau \), then \( \text{Diff}_L^i \wedge \neg \text{Diff}_L^{i-1} \rightarrow \neg \text{Set}_L^i \vee \text{Val}_L^i \) is a simple corollary of the definition lines \( \text{Diff}_L^i \leftrightarrow \text{Diff}_L^{i-1} \vee (\text{Eq}_L^{= \tau \cup x} \wedge (\neg \text{Set}_L^i \vee (\text{Set}_L^i \wedge (\text{Val}_L^i \oplus \text{Val}_L^i)))) \), \( \text{Set}_L^i \) and
\neg \text{Val}_i^L. \text{But as } \text{anno}_{x,L}(\tau \sqcup \sigma) \text{ consists on } \text{Set}_i^L \land \neg u_i, \text{ and } L \text{ consists on } \text{Val}_i^L \leftrightarrow u_i \text{ we get } \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma).

Finally if \(*/u_i \in \sigma\), then \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \neg \text{Set}_i^L \text{ is a corollary of the definition line } \text{Dif}_i^L \leftrightarrow \text{Dif}_{i-1}^L \lor (E_{\text{Dif}_i^L} \land \neg \text{Set}_i^L). \text{ But as } \text{anno}_{x,L}(\tau \sqcup \sigma) \text{ consists on } \text{Set}_i^L \text{ we get } \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma).

L \land \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma) \text{ is not quite as strong as } L \land \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma). \text{ However here we can use } \text{Dif}_j^L \rightarrow \lor_{i=1}^j \text{Dif}_i^L \land \neg \text{Dif}_{i-1}^L \text{ which will give us } L \land \text{Dif}_j^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma) \text{ in a linear size proof which is also symmetric for } R. \text{ } \square

**Lemma 5.5.** For any \(0 \leq j \leq m\) the following propositions are true and have a short Extended Frege proof.

- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow \text{Eq}_{L=\tau \sqcup \sigma}^j\)
- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow \text{Eq}_{R=\tau \sqcup \xi}^j\)
- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow (\neg \text{Set}_i^B \land \neg \text{Set}_i^L \land \neg \text{Set}_j^R) \text{ when } u_j \notin \text{dom}(\tau \sqcup \sigma \sqcup \xi).\)
- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow (\text{Set}_i^B \land \text{Set}_i^L \land \text{Set}_j^R \land (\text{Val}_i^L \leftrightarrow \text{Val}_i^L) \land (\text{Va}_L^B \leftrightarrow \text{Val}_j^R)) \text{ when } u_j \in \text{dom}(\tau).\)
- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow (\text{Set}_i^B \land \text{Set}_i^L \land \text{Set}_j^R \land (\text{Val}_i^L \leftrightarrow \text{Val}_i^L)) \text{ when } */u_j \in \sigma.\)
- \(\neg \text{Dif}_j^L \land \neg \text{Dif}_j^R \rightarrow (\text{Set}_i^B \land \text{Set}_i^L \land \text{Set}_j^R \land (\text{Val}_i^L \leftrightarrow \text{Val}_j^R)) \text{ when } */u_j \in \xi.\)

**Lemma 5.6.** Suppose \(L \rightarrow \text{con}_L(\text{C}_1 \lor \neg \text{x} \tau \lor \sigma)\) and \(R \rightarrow \text{con}_R(\text{C}_1 \lor \text{x} \tau \lor \xi)\) The following propositions are true and have short Extended Frege proofs.

- \(B \land \text{Dif}_i^L \rightarrow L\)
- \(B \land \neg \text{Dif}_i^R \land \text{Dif}_j^R \rightarrow R\)
- \(B \land \text{Dif}_i^L \rightarrow \text{con}_B(\text{inst}(\sigma, C_1))\)
- \(B \land \neg \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow \text{con}_B(\text{inst}(\sigma, C_2))\)

**Sketch Proof.** We break each of these statements up into constituent parts that we will prove individually and piece together through conjunction.

Take \(B \land \text{Dif}_i^L \rightarrow L\), we can prove this by showing for each index \(i\) that \((\text{Dif}_i^L \land (\text{Set}_i^B \rightarrow (u_i \leftrightarrow \text{Val}_i^L))) \rightarrow (\text{Set}_i^L \rightarrow (u_i \leftrightarrow \text{Val}_i^L))\). We can split up \(B \land \neg \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow R\) similarly.

For \((B \land \text{Dif}_i^L) \rightarrow \text{con}_B(\text{inst}(\xi, C_1))\), we first have to derive \((L \rightarrow \text{con}_L(C_1)) \rightarrow (B \land \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow \text{con}_B(\text{inst}(\xi, C_1))\)). We can cut out the \(L\) with \(B \land \text{Dif}_i^L \rightarrow L\). We will also remove \((L \rightarrow \text{con}_L(C_1))\). By using the premise \((L \rightarrow \text{con}_L(C_1 \lor \neg \text{x} \tau \lor \sigma))\) and crucially Lemma 5.4. \(L \land \text{Dif}_i^L \rightarrow \neg \text{anno}_{x,L}(\tau \sqcup \sigma)\), so \(L \land \text{Dif}_i^L \rightarrow \neg \text{con}_L(\neg \text{x} \tau \lor \sigma)\), and thus \((L \land \text{Dif}_i^L \rightarrow \text{con}_L(C_1))\).

We want to again split this up to the component parts. We first split by individual literals of \(C_1\) as a proof of \((L \rightarrow \text{con}_L(l^a)) \rightarrow (B \land \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow \text{con}_B(\text{inst}(l^a)))\) for each literal \(l^a \in C_1\). We then split this between existential literal \((L \rightarrow l) \rightarrow (B \land \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow l)\) (which is a basic tautology) and universal annotation \((L \rightarrow \text{anno}_{x,L}(\alpha)) \rightarrow (B \land L \land \text{Dif}_i^L \rightarrow \text{anno}_{x,L}(\alpha \land \text{restrict}_l(\xi)))\).

The latter part splits further. A maximum of one of \(\neg \text{Set}_i^B, \text{Set}_i^B \land u_i\) and \(\text{Set}_i^B \land \neg u_i\) appears in \(\text{anno}_{x,L}(\alpha \land \text{restrict}_l(\xi))\), we treat \(\text{anno}_{x,L}(\alpha \land \text{restrict}_l(\xi))\) as a set containing these subformulas. We show that if formula \(c_i \in \text{anno}_{x,L}(\alpha \land \text{restrict}_l(\xi)), \text{ when } c_i\) is equal to \(\neg \text{Set}_i^B, \text{Set}_i^B \land u_i \text{ or Set}_i^B \land \neg u_i\) then \((L \rightarrow \text{anno}_{x,L}(\alpha)) \rightarrow (B \land L \land \text{Dif}_i^L \rightarrow c_i)\). A similar breakdown happens for \(B \land \neg \text{Dif}_i^L \land \text{Dif}_j^R \rightarrow \text{con}_B(\text{inst}(\sigma, C_2))\).

Each of these individual cases is a constant size proof. You need to multiply for the length of each annotation (including missing values) and then do this again for each annotated
Theorem 5.9. eFrege + \forall red simulates IRM-calc.
Proof. For each line $C$ we create a policy $S$ such that $S \rightarrow \text{con}_S(C)$.

**Axiom** Suppose $C \in \phi$ and it is downloaded as $D = \text{inst}(C, \tau)$ for partial annotation $\tau$. We construct strategy $B$ so that $B \rightarrow \text{con}_B(D)$.

- $\text{Set}_B^i$ is defined by $\text{Set}_B^i = 1$ if $u_j \in \text{dom}(\tau)$, $\text{Set}_B^i = 0$ if $u_j \notin \text{dom}(\tau)$.
- $\text{Val}_B^i = 1$ if $1/u_j \in \tau$.
- $\text{Val}_B^i = 0$ if $0/u_j \in \tau$.

**Instantiation** Suppose we have instantiation step on $C$ on a single universal variable $u_i$ using instantiation $0/u_i$. So the new annotated clause is $D = \text{inst}(C, 0/u_i)$.

From the induction hypothesis $T \rightarrow \text{con}_T(C)$ we will develop $B$ such that $B \rightarrow \text{con}_B(D)$.

- $\text{Val}_B^i \leftrightarrow \text{Val}_T^i \land \text{Set}_T^i$ (for instantiation by 1 we use a disjunction instead)
- $\text{Set}_B^i = 1$
- $\text{Val}_B^i \leftrightarrow \text{Val}_T^i$, for $j \neq i$
- $\text{Set}_B^i \leftrightarrow \text{Set}_T^i$, for $j \neq i$

**Merge** When merging the local strategy need not change. When literals $l^n$ and $l^B$ are merged the strategy only has to occasionally satisfy a $\text{Set}_B^i$ variable instead of a $\text{Set}_B^i \land u_i$ or $\text{Set}_B^i \land \neg u_i$, so the condition that needs to be satisfied is weaker.

**Resolution** See the definition of $B$ and Lemma 5.8.

**Contradiction** At the end of the proof we have $T \rightarrow \text{con}_T(\bot)$. $T$ is a policy, so we turn it into a strategy $B$ by having for each $i$

- $\text{Val}_B^i \leftrightarrow (\text{Val}_T^i \land \text{Set}_T^i)$
- $\text{Set}_B^i = 1$

Effectively this instantiates $\bot$ by the assignment that sets everything to 0 and we can argue that $B \rightarrow \text{con}_B(\bot)$ although $\text{con}_B(\bot)$ is just the empty clause. so we have $\neg B$. But $\neg B$ is just $\bigvee_{i=1}^{n} (u_i \oplus \text{Val}_B^i)$. In eFrege $\forall \text{red}$ we can use the reduction rule (this is the first time we use the reduction rule). The proof follows from [Che21]. We show an inductive proof of $\bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$ for increasing $k$ eventually leaving us with the empty clause. This essentially is where we use the $\forall$-Red rule. Since we already have $\bigvee_{i=1}^{n} (u_i \oplus \text{Val}_B^i)$ we have the base case and we only need to show the inductive step.

We derive from $\bigvee_{i=1}^{n-1-k} (u_i \oplus \text{Val}_B^i)$ both $(0 \oplus \text{Val}_B^{n-k+1}) \lor \bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$ and $(1 \oplus \text{Val}_B^{n-k+1}) \lor \bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$ from reduction. We can resolve both with the easily proved tautology $(0 \leftrightarrow \text{Val}_B^{n-k+1}) \lor (1 \leftrightarrow \text{Val}_B^{n-k+1})$ which allows us to derive $\bigvee_{i=1}^{n-k} (u_i \oplus \text{Val}_B^i)$.

We continue this until we reach the empty disjunction. 

**Corollary 5.10.** eFrege $\forall \text{red}$ simulates LD-Q-Res.

### 6. Extended Frege+$\forall$-Red p-simulates LQU$^+$-Res

#### 6.1. QCDCL Resolution Systems

The most basic and important CDCL system is $Q$-resolution ($Q$-Res) by Kleine Büning et al. [KKF95]. Long-distance resolution (LD-Q-Res) appears originally in the work of Zhang and Malik [ZM02] and was formalised into a calculus by Balabanov and Jiang [BJ12]. It merges complementary literals of a universal variable $u$ into the special literal $u^\ast$. These special literals prohibit certain resolution steps. $\text{QU}$-resolution (QU-Res) [VG12] removes the restriction from Q-Res that the resolved
variable must be an existential variable and allows resolution of universal variables. LQU$^+$-Res [BWJ14] extends LD-Q-Res by allowing short and long distance resolution pivots to be universal, however, the pivot is never a merged literal $z^*$. LQU$^+$-Res encapsulates Q-Res, LD-Q-Res and QU-Res.

$$\frac{C}{D \cup \{u\}} \quad \frac{D \cup \{u\}}{D} \quad \frac{D \cup \{u\}}{D \cup \{u\}}$$

(Axiom) \quad (\forall\text{-Red}) \quad (\forall\text{-Red}^*)

$C$ is a clause in the original matrix. Literal $u$ is universal and $\text{lv}(u) \geq \text{lv}(l)$ for all $l \in D$.

$$\frac{C_1 \cup U_1 \cup \{-x\} \quad C_2 \cup U_2 \cup \{x\}}{C_1 \cup C_2 \cup U^*}$$

(Res)

We consider two settings of the Res-rule:

SR: If $z \in C$, then $\neg z \notin C_2$. $U_1 = U_2 = U^* = \emptyset$.

LR: If $l_1 \in C_1, l_2 \in C_2$, and $\text{var}(l_1) = \text{var}(l_2) = z$ then $l_1 = l_2 \neq z^*$. $U_1, U_2$ contain only universal literals with $\text{var}(U_1) = \text{var}(U_2)$. $\text{ind}(x) < \text{ind}(u)$ for each $u \in \text{var}(U_1)$.

If $w_1 \in U_1, w_2 \in U_2$, $\text{var}(w_1) = \text{var}(w_2) = u$ then $w_1 = \neg w_2$ or $w_1 = u^*$ or $w_2 = u^*$. $U^* = \{u^* | u \in \text{var}(U_1)\}$.

For $b = \{1, 2\}$, define $V_b = \{u^* | u^* \in C_b\}$. In other words $V_b$ is the subclause of $C_b \lor U_b$ of starred literals left of $x$.

Figure 5: The rules of LQU$^+$-Res [BWJ14].

6.2. Conversion to Propositional Logic and Simulation. LQU$^+$-Res and IRM-calc are mutually incomparable in terms of proof strength, however both share enough similarities to get the simulation working. Once again we can use $\text{Set}^i_S$ variables to represent an $u^*_i$, and a $\neg \text{Set}^i_S$ to represent that policy $S$ chooses not to issue a value to $u_i$.

For any set of universal variables $Y$, let $\text{anno}_{x,S}(Y) = \bigwedge_{u_j \in Y} \neg \text{Set}^i_S \land \bigwedge_{w_j \notin x} \text{Set}^i_S$. Note that we do not really need to add polarities to the annotations, these are taken into account by the clause literals. Literals $u$ and $\bar{u}$ do not need to be assigned by the policy, they are now treated as a consequence of the CNF. Because they can be resolved we treat them like existential variables in the conversion. For universal variable $u_i$, $\text{con}_{S,C}(u_i) = u_i \land \neg \text{Set}^i_S \land \text{anno}_{x,S}(\{u | u^* \in C\})$ and $\text{con}_{S,C}(-u_i) = -u_i \land \neg \text{Set}^i_S \land \text{anno}_{x,S}(\{u | u^* \in C\})$. We reserve $\text{Set}^i_S$ for starred literals as they cannot be removed. For existential literal $x$, $\text{con}_{S,C}(x) = x \land \text{anno}_{x,S}(\{u | u^* \in C\})$. Finally, $\text{con}_{S,C}(u^*) = \bot$, because we do not treat $u^*$ as a literal but part of the “annotation” to literals right of it. Also, $u^*$ cannot be resolved but it is automatically reduced when no more literals are to the right of it. For clauses in LQU$^+$-Res, we let $\text{con}_S(C) = \bigvee_{l \in C} \text{con}_{S,C}(l)$. In summary, in comparison to IRM-calc the conversion now includes universal variables and gives them annotations, but removes polarities from the annotations. Policies still remain structured as they were for IRM-calc, with extension variables $\text{Val}^i_S$ and $\text{Set}^i_S$, where $S = \bigwedge_{i=1}^n \text{Set}^i_S \rightarrow (u_i \leftrightarrow \text{Val}^i_S)$.

We will once again focus on the resolution case, using the notation as given in Figure 5.

**Observation 6.1.** $V_1 \cap V_2 = \emptyset$ by definition of resolution in LQU$^+$-Res (see Figure 5).

We use $L$ to denote the local policy of $C_1 \cup U_1 \cup \{-x\}$, $R$ to denote the local policy of $C_2 \cup U_2 \cup \{x\}$, and $B$ is intended to be the local policy for the resolvent $C_1 \cup C_2 \cup U$. Once again we use $\text{Set}^i_S, \text{Set}^i_R, \text{Set}^i_B, \text{Val}^i_L, \text{Val}^i_R, \text{Val}^i_B$ to describe the constituent parts of it.
6.2.1. Equivalence. The notation for equivalence slightly changes due to the fact we are no longer working with annotations, but present starred literals. These work in much the same way. Let $b$ be in $\{1, 2\}$

$$\text{Eq}^0_{f,V_b} := 1$$

$$\text{Eq}^i_{f,V_b} := \text{Eq}^{i-1}_{f,g} \land \text{Set}^i_f$$ when $u_i^* \in V_b$

$$\text{Eq}^i_{f,g} := \text{Eq}^{i-1}_{f,g} \land (\neg \text{Set}^i_f)$$ when $u_i^* \notin V_b$

6.2.2. Difference. $\text{Dif}^0_L := 0$ and $\text{Dif}^0_R := 0$

For $u_i^* \notin C_1 \cup C_2$,

$$\text{Dif}^i_L := \text{Dif}^{i-1}_L \lor (\text{Eq}^{i-1}_L \land \text{Set}^i_L)$$

$$\text{Dif}^i_R := \text{Dif}^{i-1}_R \lor (\text{Eq}^{i-1}_L \lor \text{Set}^i_R)$$

For $u_i^* \in C_1$,

$$\text{Dif}^i_L := \text{Dif}^{i-1}_L \lor (\text{Eq}^{i-1}_L \land \neg \text{Set}^i_L)$$

$$\text{Dif}^i_R := \text{Dif}^{i-1}_R \lor (\text{Eq}^{i-1}_R \land \text{Set}^i_R)$$

For $u_i^* \in C_2$,

$$\text{Dif}^i_L := \text{Dif}^{i-1}_L \lor (\text{Eq}^{i-1}_L \lor \text{Set}^i_L)$$

$$\text{Dif}^i_R := \text{Dif}^{i-1}_R \lor (\text{Eq}^{i-1}_R \land \neg \text{Set}^i_R)$$

6.2.3. Policy Variables. For $u_i^* \notin C_1 \cup C_2$, $i \leq m$

$$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (\text{Val}^i_L, \text{Set}^i_R) & \text{if } \neg \text{Dif}^{i-1}_L \land (\text{Dif}^{i-1}_R \lor \neg \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$$

For $u_i^* \in C_1$, $i \leq m$

$$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (0, 1) & \text{if } \neg \text{Dif}^{i-1}_L \land \text{Dif}^{i-1}_R \land \neg \text{Set}^i_R \\ (\text{Val}^i_L, \text{Set}^i_R) & \text{if } \neg \text{Dif}^{i-1}_L \land \text{Set}^i_R \land (\text{Dif}^{i-1}_R \lor \neg \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$$

For $u_i^* \in C_2$, $i \leq m$

$$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (0, 1) & \text{if } \text{Dif}^{i-1}_L \land \neg \text{Set}^i_L \\ (\text{Val}^i_L, \text{Set}^i_R) & \text{if } \neg \text{Dif}^{i-1}_L \land (\text{Dif}^{i-1}_R \lor \neg \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$$

For $u_i \in \text{dom}(U)$, $i > m$

$$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (\text{Val}^i_L, \text{Set}^i_R) & \text{if } \text{Set}^i_R \land \neg \text{Dif}^m_R \land (\text{Dif}^m_L \lor \neg x) \\ (0, 1) & \text{if } u_i \in U_2 \text{ and } \neg \text{Set}^i_R \land \neg \text{Dif}^m_R \land (\text{Dif}^m_L \lor \neg x) \\ (1, 1) & \text{if } u_i \notin U_2 \text{ and } \neg \text{Set}^i_R \land \neg \text{Dif}^m_R \land (\text{Dif}^m_L \lor \neg x) \\ (0, 1) & \text{if } u_i \notin U_2 \text{ and } \neg \text{Set}^i_R \land \neg \text{Dif}^m_R \land (\text{Dif}^m_L \lor \neg x) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } \text{Set}^i_L \land \text{Dif}^m_L \land (\neg \text{Dif}^m_R \land x) \\ (0, 1) & \text{if } u_i \in U_1 \text{ and } \neg \text{Set}^i_L \land (\text{Dif}^m_L \land (\neg \text{Dif}^m_R \land x)) \\ (1, 1) & \text{if } u_i \in U_1 \text{ and } \neg \text{Set}^i_L \land (\text{Dif}^m_L \land (\neg \text{Dif}^m_R \land x)) \\ (0, 1) & \text{if } u_i \notin U_1 \text{ and } \neg \text{Set}^i_L \land (\text{Dif}^m_L \land (\neg \text{Dif}^m_R \land x)) \end{cases}$$

For $u_i \notin \text{dom}(U)$, $i > m$
Proof. The proof of Lemma 4.5 still works despite the modifications to definition.

Lemma 6.3. For $0 \leq i \leq j \leq m$ the following propositions that describe the monotonicity of $\text{Dif}$ and $\text{Eq}$ have short derivations in Extended Frege:

- $\text{Dif}_L^i \rightarrow \bigvee_{i=1}^j \text{Dif}_L^i \land \lnot \text{Dif}_L^{i-1}$
- $\text{Dif}_R^i \rightarrow \bigvee_{i=1}^j \text{Dif}_R^i \land \lnot \text{Dif}_R^{i-1}$
- $\lnot \text{Eq}^j_{L,V_1} \rightarrow \bigvee_{i=1}^j \lnot \text{Eq}^j_{L,V_1} \land \text{Eq}^{i-1}_{L,V_1}$
- $\lnot \text{Eq}^j_{R,V_2} \rightarrow \bigvee_{i=1}^j \lnot \text{Eq}^j_{R,V_2} \land \text{Eq}^{i-1}_{R,V_2}$

Proof. The proofs of Lemma 4.6 still work despite the modifications to definition.

Lemma 6.4. For any $0 \leq i \leq m$ the following propositions are true and have short Extended Frege proofs.

- $\text{Dif}_L^i \rightarrow \lnot \text{anno}_{x,L}(V_1)$
- $\text{Dif}_R^i \rightarrow \lnot \text{anno}_{x,R}(V_2)$

Proof. If $u_i \notin V_1$ then $\text{Dif}_L^i \land \lnot \text{Dif}_L^{i-1} \rightarrow \text{Set}_L^i$ but $\text{anno}_{x,L}(V_1)$ insists on $\lnot \text{Set}_L^i$.

If $u_i \in V_1$ then $\text{Dif}_L^i \land \lnot \text{Dif}_L^{i-1} \rightarrow \lnot \text{Set}_L^i$ but $\text{anno}_{x,L}(V_1)$ insists on $\text{Set}_L^i$. This is done similarly for $R$.

Lemma 6.5. For any $0 \leq j \leq m$ the following propositions are true and have a short Extended Frege proof.

- $\lnot \text{Dif}_L^j \land \lnot \text{Dif}_R^j \rightarrow \text{Eq}^j_{L,V_1}$
- $\lnot \text{Dif}_L^j \land \lnot \text{Dif}_R^j \rightarrow \text{Eq}^j_{R,V_2}$
- $\lnot \text{Dif}_L^j \land \lnot \text{Dif}_R^j \rightarrow (\lnot \text{Set}_B^j \land \lnot \text{Set}_L^j \land \lnot \text{Set}_R^j)$ when $u^*_j \notin C_1 \cup C_2$.
- $\lnot \text{Dif}_L^j \land \lnot \text{Dif}_R^j \rightarrow (\text{Set}_B^j \land \text{Set}_L^j \land \text{Set}_R^j \land (\text{Val}_B \leftrightarrow \text{Val}_L^j))$ when $u^*_j \in C_1$. 

One may notice there are a larger number of cases for $i > m$ than in previous sections, this is because $u$ and $\lnot u$ become $u^*$ and end up joining the annotation and policies. It should also be pointed out that there are cases resulting $(0, 1)$ than to $(1, 1)$ this is simply matter of using 0 as the default value when some set has to be made.

Lemma 6.2. For $0 < j \leq m$ the following propositions have short derivations in Extended Frege:

- $\text{Dif}_L^j \rightarrow \bigvee_{i=1}^j \text{Dif}_L^i \land \lnot \text{Dif}_L^{i-1}$
- $\text{Dif}_R^j \rightarrow \bigvee_{i=1}^j \text{Dif}_R^i \land \lnot \text{Dif}_R^{i-1}$
- $\lnot \text{Eq}^j_{L,V_1} \rightarrow \bigvee_{i=1}^j \lnot \text{Eq}^j_{L,V_1} \land \text{Eq}^{i-1}_{L,V_1}$
- $\lnot \text{Eq}^j_{R,V_2} \rightarrow \bigvee_{i=1}^j \lnot \text{Eq}^j_{R,V_2} \land \text{Eq}^{i-1}_{R,V_2}$
\[ \neg \text{Dif}_1^j \land \neg \text{Dif}_2^j \rightarrow (\text{Set}_B^j \land \neg \text{Set}_L^j \land \text{Set}_R^j \land (\text{Val}_B^j \leftrightarrow \text{Val}_R^j)) \text{ when } u_j^* \notin C_2. \]

**Proof.** We show that \( \neg \text{Eq}_{L,V_1}^{j+1} \rightarrow \neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \) and \( \neg \text{Eq}_{R,V_2}^j \lor \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \). Suppose \( u_{j+1}^* \in V_1 \) then \( \neg \text{Eq}_{L,V_1}^{j+1} \land \text{Eq}_{L,V_1}^j \rightarrow \text{Set}_{L}^{j+1} \) and \( \text{Set}_{L}^{j+1} \rightarrow \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \), so we have \( \neg \text{Eq}_{L,V_1}^{j+1} \lor \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1} \). This is symmetric for \( R \) and for \( u_{j+1}^* \notin V_1 \).

**Induction Hypothesis (on \( j \)):** \( \neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j \rightarrow (\text{Dif}_{L}^j \lor \text{Dif}_{R}^j) \).

**Base Case** \( (j = 1) \): \( \neg \text{Eq}_{L,V_1}^1 \land \text{Eq}_{L,V_1}^0 \rightarrow \text{Dif}_{L}^1 \lor \neg \text{Eq}_{R,V_2}^0 \) and \( \neg \text{Eq}_{R,V_2}^1 \land \text{Eq}_{R,V_2}^0 \rightarrow \text{Dif}_{R}^1 \lor \neg \text{Eq}_{L,V_1}^0 \).

However since \( \text{Eq}_{L,V_1}^0 \land \text{Eq}_{R,V_2}^0 \) are both true it simplifies to \( \neg \text{Eq}_{L,V_1}^1 \rightarrow \text{Dif}_{L}^1 \) and \( \neg \text{Eq}_{R,V_2}^1 \rightarrow \text{Dif}_{R}^1 \) which can be combined to get \( \neg \text{Eq}_{L,V_1}^1 \lor \neg \text{Eq}_{R,V_2}^1 \rightarrow (\text{Dif}_{L}^1 \lor \text{Dif}_{R}^1) \).

**Inductive Step** \( (j + 1) \):

The Induction Hypothesis \( (\neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j) \rightarrow (\text{Dif}_{L}^j \lor \text{Dif}_{R}^j) \) can be weakened to \( (\neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j) \rightarrow (\text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1}) \), using \( \text{Dif}_{L}^j \rightarrow \text{Dif}_{L}^{j+1} \) and \( \text{Dif}_{R}^j \rightarrow \text{Dif}_{R}^{j+1} \).

We now need to replace \( (\neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j) \) with \( (\neg \text{Eq}_{L,V_1}^{j+1} \lor \neg \text{Eq}_{R,V_2}^{j+1}) \). Suppose \( u_{j+1} \in V_1 \), note that \( \neg \text{Eq}_{L,V_1}^{j+1} \rightarrow \neg \text{Eq}_{L,V_1}^j \lor \neg \text{Set}_{L}^{j+1} \), \( \neg \text{Set}_{L}^{j+1} \land \text{Eq}_{R,V_2}^j \rightarrow \text{Dif}_{R}^{j+1} \). We show that \( \neg \text{Eq}_{L,V_1}^{j+1} \rightarrow \neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \) and \( \neg \text{Eq}_{R,V_2}^{j+1} \rightarrow \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1} \).

Suppose \( u_{j+1}^* \in V_1 \) then \( \neg \text{Eq}_{L,V_1}^{j+1} \land \text{Eq}_{L,V_1}^j \rightarrow \text{Set}_{L}^{j+1} \land \text{Set}_{L}^{j+1} \rightarrow \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1} \), so we have \( \neg \text{Eq}_{L,V_1}^{j+1} \land \rightarrow \neg \text{Eq}_{R,V_2}^j \lor \neg \text{Eq}_{L,V_1}^j \lor \text{Dif}_{L}^{j+1} \) and \( \text{Dif}_{R}^{j+1} \lor \text{Dif}_{R}^{j+1} \). This is symmetric for \( R \) and for \( u_{j+1}^* \notin V_1 \).

We can use these formulas to show \( \neg \text{Eq}_{L,V_1}^{j+1} \land \neg \text{Eq}_{R,V_2}^{j+1} \rightarrow \neg \text{Eq}_{L,V_1}^j \lor \neg \text{Eq}_{R,V_2}^j \lor \text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1} \) and we can simplify this to \( \neg \text{Eq}_{L,V_1}^{j+1} \land \neg \text{Eq}_{R,V_2}^{j+1} \rightarrow \text{Dif}_{L}^{j+1} \lor \text{Dif}_{R}^{j+1} \).

\( \neg \text{Dif}_{L}^j \land \neg \text{Dif}_{R}^j \rightarrow \text{Eq}_{L,V_1}^j \), \( \neg \text{Dif}_{L}^j \land \neg \text{Dif}_{R}^j \rightarrow \text{Eq}_{R,V_2}^j \) are corollaries of this.

\( \neg \text{Dif}_{L}^j \land \neg \text{Dif}_{R}^j \) means \( \neg \text{Dif}_{L}^{j-1} \land \neg \text{Dif}_{R}^{j-1} \). \( u_j^* \in C_1 \) implies \( u_j^* \notin C_2 \), so \( \text{Set}_L^j \) and \( \neg \text{Set}_R^j \), and that makes \( (\text{Val}_B^j, \text{Val}_R^j) = (\text{Val}_L^j, \text{Val}_L^j) \).

\( u_j^* \notin C_2 \) implies \( u_j^* \notin C_1 \) so \( \neg \text{Set}_L^j \) and \( \text{Set}_R^j \), and that makes \( (\text{Val}_B^j, \text{Val}_R^j) = (\text{Val}_R^j, \text{Val}_R^j) \).

\( u_j^* \notin C_1 \land C_2 \) implies \( \neg \text{Set}_L^j \) and \( \neg \text{Set}_R^j \), therefore \( (\text{Val}_B^j, \text{Val}_R^j) = (\text{Val}_L^j, \text{Val}_L^j) \).

\[ \Box \]

**Lemma 6.6.** The following propositions are true and have short Extended Frege proofs, given \( L \rightarrow \text{con}_L(C_1 \cup U_1 \lor \neg x) \) and \( R \rightarrow \text{con}_R(C_2 \cup U_2 \lor x) \):

- \( B \land \text{Dif}_{L}^m \rightarrow L \)
- \( B \land \neg \text{Dif}_{L}^m \land \text{Dif}_{R}^m \rightarrow R \)
- \( B \land \text{Dif}_{L}^m \rightarrow \text{con}_B(C_1 \lor V_2 \lor U^*) \)
- \( B \land \neg \text{Dif}_{L}^m \land \text{Dif}_{R}^m \rightarrow \text{con}_B(C_2 \lor V_1 \lor U^*) \)

**Sketch Proof.** We break \( B \land \text{Dif}_{L}^m \rightarrow L \) into individual parts \( \text{Set}_B^j \rightarrow (u_i \leftrightarrow \text{Val}_B^j) \land \text{Dif}_{L}^m \rightarrow (\text{Set}_L^j \rightarrow (u_i \leftrightarrow \text{Val}_L^j)) \) which we join by conjunction. We can do similarly for \( B \land \neg \text{Dif}_{L}^m \land \text{Dif}_{R}^m \rightarrow R \).

For \( B \land \text{Dif}_{L}^m \rightarrow \text{con}_B(C_1 \lor V_2 \lor U^*) \) we first derive \( L \rightarrow \text{con}_L(C_1 \cup U_1 \lor \neg x) \) \( (B \land L \land \text{Dif}_{L}^m \rightarrow \text{con}_B(C_1 \lor V_2 \lor U^*)) \), you can cut out \( L \) using \( B \land \text{Dif}_{L}^m \rightarrow L \). Removing \( L \rightarrow \text{con}_L(C_1 \cup U_1 \lor \neg x) \), uses the premise \( L \rightarrow \text{con}_L(C_1 \cup U_1 \lor \neg x) \).
To derive \((L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x)) \rightarrow (B \wedge L \wedge \text{Diff}^m_L \rightarrow \text{con}_B(C_1 \vee V_2 \vee U^*))\) we break this by non-starred literals \(l \in C_1 \cup U_1\) so we will show that \((L \rightarrow \text{con}_{L,C_1 \cup U_1 \vee \neg x}(l)) \rightarrow (B \wedge \text{Diff}^m_L \rightarrow \text{con}_{B,V_2 \cup C_1 \cup U}(l))\). \(\text{Diff}^m_L \rightarrow \neg \text{anno}_{x,L}(V_1)\) is used to remove the \(x\) literal.

For \(p \in \{1, 2\}\) let \(W_p = \{u^* \mid u^* \in U_p\}\). For each \(i\), either \(\text{Set}^i_B\) or \(\neg \text{Set}^i_B\) appears in \(\text{anno}_{i,B}(V_1 \cup V_2 \cup U^*)\), so we treat \(\text{anno}_{i,B}(V_1 \cup V_2 \cup U^*)\) as a set containing these subformulas. We show that if \(c_i \in \text{anno}_{i,B}(V_1 \cup V_2 \cup U^*)\) when \(c_i = \text{Set}^i_B\) or \(c_i = \neg \text{Set}^i_B\), then \(L \rightarrow \text{anno}_{i,L}(V_1 \cup V_1) \rightarrow B \wedge \text{Diff}^m_L \rightarrow c_i\) and we also have \((L \rightarrow l) \rightarrow (B \wedge \text{Diff}^m_L \rightarrow l)\).

For existential \(l\), we can use these all together to get \((L \rightarrow \text{con}_{L,C_1 \cup U_1}(l)) \rightarrow (B \wedge L \wedge \text{Diff}^m_L \rightarrow \text{con}_{B,V_2 \cup C_1 \cup U}(l))\). For universal literals \(u_k\) we also need to show \(\neg \text{Set}^k_B\) is preserved when \(u_k\) is not merged. For universal literals \(u_k\) that are merged \(\text{con}_{B,V_2 \cup C_1 \cup U^*}(u_k) = \bot\) so we show that the strategy for \(B\) causes a contradiction between \(B\) and \(L \rightarrow u_k\). We do similarly for \(B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow \text{con}_B(C_2 \vee V_1 \vee U^*)\).

We detail all cases for \(L\) and \(R\) in the Appendix.

\[\square\]

**Lemma 6.7.** The following propositions are true and have short Extended Frege proofs, given \((L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x))\) and \((R \rightarrow \text{con}_R(C_2 \cup U_2 \vee x))\).

- \(B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow \text{con}_B(C_1 \vee V_2 \vee U^*) \lor \neg x\)
- \(B \land \neg \text{Diff}^m_L \land \neg \text{Diff}^m_R \rightarrow \text{con}_B(C_2 \vee V_1 \vee U^*) \lor x\)

**Proof.** For indices \(1 \leq i \leq m\), but since \(\neg \text{Diff}^m_L \rightarrow \neg \text{Diff}^i_L\) and \(\neg \text{Diff}^m_R \rightarrow \neg \text{Diff}^i_R\), Lemma 4.9 can be used to show that \(B \land \text{Diff}^m_L \land \text{Diff}^m_R\) leads to \(\text{Set}^i_B\) taking the value consistent with both \(V_1 \vee V_2\) if \(L\) was consistent with \(V_1\) and \(R\) was consistent with \(V_2\).

For \(i > m\), \(\neg \text{Diff}^m_R \land \neg \text{Diff}^m_R\) will make the policy \(B\) pick between the left and right policy based on \(x\). However in either case \(\text{Set}^i_B\) will be forced to update based on the new annotations.

\[\square\]

**Lemma 6.8.** Suppose, there are policies \(L\) and \(R\) such that \(L \rightarrow \text{con}_L(C_1 \vee \neg x \vee U_1)\) and \(R \rightarrow \text{con}_R(C_2 \vee x \vee U_2)\) then there is a policy \(B\) such that \(B \rightarrow \text{con}_B(C_1 \vee C_2 \vee U^*)\) can be obtained in a short eFrege proof, where \(C_1, C_2, U_1, U_2\) and \(U^*\) follow the same definitions as in Figure 5.

**Proof.** From Lemmas 6.7 and 6.6, \(\text{con}_B(C_1 \vee V_2 \vee U^*)\) and \(\text{con}_B(C_2 \vee V_1 \vee U^*)\) can be weakened to \(\text{con}_B(C_1 \vee C_2 \vee U^*)\). These can all be combined over the different possibilities to give \(B \rightarrow \text{con}_B(C_1 \vee C_2 \vee U^*)\).

\[\square\]

**Theorem 6.9.** eFrege + \(\forall\text{red}\) simulates LQU\(^+\)-Res.

**Proof.** We inductively build a policy \(S\) such that \(S \rightarrow \text{con}_S(C)\) can be proved from \(\phi\) using eFrege, for every clause \(C\) in an LQU\(^+\)-Res proof. At the end we have the empty clause and a strategy and we can use reduction to remove the strategy and obtain the empty clause as in Theorems 3.3 and 4.15.

**Axiom** Each Axiom is treated with the empty policy.

**Reduction** \((u_i\) or \(\neg u_i)\) If the clause contains literal \(u_i\), we know that \(T \rightarrow \text{con}_T(C \vee u_i)\).

We define \(S\) so that.

\[\text{Val}_S^j, \text{Set}_S^j = \begin{cases} \text{Val}_T^j, \text{Set}_T^j & \text{if } \text{Set}_T \lor \text{con}_T(C) \text{ is satisfied,} \\ \emptyset & \text{otherwise.} \end{cases}\]

We need to show that \(S \rightarrow \text{con}_S(C)\). Note that \(\text{con}_T(C \vee u_i) = \text{con}_T(C) \lor \text{con}_T(C)(u_i)\). Therefore \(T \rightarrow \text{con}_T(C)\) or \(T \rightarrow \neg \text{Set}_T \land u_i\). If \(\text{Set}_T\) is true or \(\text{con}_T(C)\) then \(T \rightarrow \text{con}_T(C)\)
is true and as $S$ will match $T$, $S \rightarrow \text{con}_S(C)$. Suppose $\text{Set}_T^i$ and $\text{con}_T(C)$ are both false. If $S$ is true, then $u_i$ is false by construction. Moreover, since $S$ agrees with $T$ on every variable except $u_i$, and $T$ does not set $u_i$, $T$ must be true as well. But since $\text{con}_T(C)$ is false, we must have $T \rightarrow \text{Set}_T^i \land u_i$. In particular, $u_i$ must be true, a contradiction. We conclude that the implication $S \rightarrow \text{con}_S(C)$ holds in this case.

**Reduction** $(u_i^*)$ If $T \rightarrow \text{con}_T(C \lor u_i^*)$ and we reduce $u_i^*$ we need to define the strategy $S$ so that $S \rightarrow \text{con}_S(C)$. Since $u_i^*$ is the rightmost literal in the clause $\text{con}_T(C \lor u_i^*) = \text{con}_T(C)$ so we define $S$ the same way as $T$.

**Resolution** See Lemma 6.8.

**Contradiction** Just as in IR-calc we have to give a complete assignment to the missing values in the policy. We then have simply the negation of the strategy for which we can apply our same technique to reduce to the empty clause.

### 7. Conclusion

Our work reconciles many different QBF proof techniques under the single system $\text{eFrege} + \forall \text{red}$. Although $\text{eFrege} + \forall \text{red}$ itself is likely not a good system for efficient proof checking, our results have implications for other systems that are more promising in this regard, such as QRAT, which inherits these simulations. In particular, QRAT's simulation of $\forall \text{Exp} + \text{Res}$ is upgraded to a simulation of IRM-calc, and we do not even require the extended universal reduction rule. Existing QRAT checkers can be used to verify converted $\text{eFrege} + \forall \text{red}$ proofs. Further, extended QU-resolution is polynomially equivalent to $\text{eFrege} + \forall \text{red}$ [Che21], and has previously been proposed as a system for unified QBF proof checking [JBS+07]. Since our simulations split off propositional inference from a standardised reduction part at the end, another option is to use (highly efficient) propositional proof checkers instead. Our simulations use many extension variables that are known to negatively impact the checking time of existing tools such as DRAT-trim, but one may hope that they can be refined to become more efficient in this regard.

There are other proof systems, particularly ones using dependency schemes, such as $Q(D^{rs})$-Res and LD-$Q(D^{rs})$-Res that have strategy extraction [PSS19b]. Local strategy extraction and ultimately a simulation by $\text{eFrege} + \forall \text{red}$ seem likely for these systems, whether it can be proved directly or by generalising the simulation results from this paper.

\end{cases}
\]

Lemma 5.6. Suppose \( L \rightarrow \text{con}_L(C_1 \lor \lnot x^{\tau L \sigma}) \) and \( R \rightarrow \text{con}_L(C_1 \lor x^{\tau L \xi}) \). The following propositions are true and have short Extended Frege proofs.

- \( B \land \text{Dif}_L^m \rightarrow L \)
- \( B \land \lnot \text{Dif}_L^m \land \text{Dif}_L^m \rightarrow R \)
- \( B \land \text{Dif}_L^m \rightarrow \text{con}_B(\text{inst}(\xi, C_1)) \)
- \( B \land \lnot \text{Dif}_L^m \land \lnot \text{Dif}_L^m \rightarrow \text{con}_B(\text{inst}(\sigma, C_2)) \)

Proof. We break each of these statements up into constituent parts that we will prove individually and piece together through conjunction.

Take \( B \land \text{Dif}_L^m \rightarrow L \), we can prove this by showing for each index \( i \) that \( \lnot \text{Dif}_L^m \land (\text{Set}_B^i \rightarrow (u_i \leftrightarrow \text{Val}_B^i))) \rightarrow (\text{Set}_L^i \rightarrow (u_i \leftrightarrow \text{Val}_L^i)) \). We can split up \( B \land \lnot \text{Dif}_L^m \land \text{Dif}_L^m \rightarrow R \) similarly.

For \( B \land \text{Dif}_L^m \rightarrow \text{con}_B(\text{inst}(\xi, C_1)) \), we first have to derive \( (L \rightarrow \text{con}_L(C_1 \lor \lnot x^{\tau L \sigma})) \). By using the premise \( (L \rightarrow \text{con}_L(C_1 \lor \lnot x^{\tau L \sigma})) \), we can cut out the \( L \) with \( B \land \text{Dif}_L^m \rightarrow L \). We will also remove \( (L \rightarrow \text{con}_L(C_1 \lor \lnot x^{\tau L \sigma})) \) and crucially Lemma 5.4. We want to again split this up to the component parts. We first split by individual literals of \( C_1 \) as a proof of \( (L \rightarrow \text{con}_L(l^n)) \). We can cut out \( B \land \text{Dif}_L^m \rightarrow \text{con}_B(\text{inst}(\xi, l^n)) \) for each literal \( l^n \in C_1 \). We then split this between existential literal \( (L \rightarrow \lnot l) \rightarrow (B \land L \land \text{Dif}_L^m \rightarrow l) \) (which is a basic tautology) and universal annotation \( (L \rightarrow \text{ann}(\alpha, B) \rightarrow (B \land \text{Dif}_L^m \rightarrow \text{ann}(\alpha, B)) \). The latter part splits further. A maximum of one of \( \lnot \text{Set}_B^i \), \( \text{Set}_B^i \land u_i \) and \( \text{Set}_B^i \land \lnot u_i \) appears in \( \text{ann}(\alpha, B) \), we treat \( \text{ann}(\alpha, B) \) as a set
containing these subformulas. We show that if formula $c_i \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$, when $c_i$ is equal to $\neg \text{Set}^i_B$, $\text{Set}^i_B$, $\text{Set}^i_B \land u_i$ or $\text{Set}^i_B \land \neg u_i$ then $(L \rightarrow \text{anno}_L(\alpha)) \rightarrow (B \land L \land \text{Diff}^m_L \rightarrow c_i)$. A similar breakdown happens for $B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow \text{con}_B(\text{inst}(\sigma, C_2))$.

Each of these individual cases is a constant size proof. You need to multiply for the length of each annotation (including missing values) and then do this again for each annotated literal in the clause. The proof size will be $O(wm)$ where $w$ is the width or number of literals in $\text{inst}(\xi, C_1) \cup \text{inst}(\sigma, C_2)$ and $m$ is the number of universal variables in the prefix.

Each $(L \rightarrow \text{anno}_L(\alpha)) \rightarrow (B \land L \land \text{Diff}^m_L \rightarrow c_i)$ fall into one of many cases. There are multiple “axes” of cases, the first being by index $i$, in the cases $i > m$, $i = 0$, $i = m$. Each $i$ refers to the index such that $\text{Diff}^m_L \land \neg \text{Diff}^{i-1}_L \land \neg \text{Diff}^{i-1}_R$ which we know exists via Lemmas 5.1 and 5.3. Lemma 5.1 is crucial to stringing these together. The next axis of cases then by choice of annotation in $\alpha \circ \text{restrict}_i(\xi)$. Further we have to consider sub-cases of these that affect the policy variables, as detailed in Section 6.2.3.

We detail the cases below:

**Suppose $i > m$.**

$\text{Diff}^m_L$ refutes $\neg \text{Diff}^m_L \land (\text{Diff}^m_R \lor \neg x_L^k)$ so whenever $\text{Diff}^m_L$ is true, $(\text{Val}^m_B, \text{Set}^m_B) = (\text{Val}^m_L, \text{Set}^m_L)$, therefore $(\text{Set}^m_B \rightarrow (u_i \leftrightarrow \text{Val}^m_B)) \rightarrow (\text{Set}^m_L \rightarrow (u_i \leftrightarrow \text{Val}^m_L))$.

If $\neg \text{Set}^m_B \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$, then $u_i \notin \text{dom}(\alpha \circ \text{restrict}_i(\xi))$. We know $u_i \notin \text{dom}(\alpha)$ otherwise it would be in $\text{dom}(\alpha \circ \text{restrict}_i(\xi))$. Therefore $\neg \text{Set}^m_B$ is in $\text{anno}_L(\alpha)$. And so if $L \rightarrow \text{anno}_L(\alpha)$ then $L \rightarrow \neg \text{Set}^m_B$, therefore $B \land L \land \text{Diff}^m_L \rightarrow \neg \text{Set}^m_B$. We now look at all the cases of $c_i \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$ and show they can be satisfied with our strategy in $B$:

If $\text{Set}^m_B \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$, then $u_i \in \text{dom}(\alpha \circ \text{restrict}_i(\xi)) u_i \notin \text{dom}(\xi)$ because $\text{dom}(\xi)$ only extends up to $m$ hence $u_i \in \text{dom}(\alpha)$ and $\text{Set}^m_B \in \text{anno}_L(\alpha)$. And so if $L \rightarrow \text{anno}_L(\alpha)$ then $L \rightarrow \text{Set}^m_B$, therefore $B \land L \land \text{Diff}^m_L \rightarrow \text{Set}^m_B$.

If $\text{Set}^m_B \land u_i \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$ then $u_i \in \alpha \circ \text{restrict}_i(\xi)$. We know $u_i \notin \text{dom}(\alpha)$ because $\text{dom}(\alpha \circ \text{restrict}_i(\xi))$ only extends up to $m$. Hence $u_i \in \alpha$ and $\text{Set}^m_B \land u_i \in \text{anno}_L(\alpha)$. And so if $L \rightarrow \text{anno}_L(\alpha)$ then $L \rightarrow \text{Set}^m_B \land u_i$, therefore $B \land L \land \text{Diff}^m_L \rightarrow \text{Set}^m_B \land u_i$.

If $\text{Set}^m_B \land \neg u_i \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$ then $\neg u_i \in \alpha \circ \text{restrict}_i(\xi)$, $u_i \notin \text{dom}(\alpha)$ because $\text{dom}(\alpha \circ \text{restrict}_i(\xi))$ only extends up to $m$. Hence $\neg u_i \in \alpha$ and $\text{Set}^m_B \land \neg u_i \in \text{anno}_L(\alpha)$ And so if $L \rightarrow \text{anno}_L(\alpha)$ then $L \rightarrow \text{Set}^m_B \land \neg \text{Val}^m_L$, therefore $B \land L \land \text{Diff}^m_L \rightarrow \text{Set}^m_B \land \neg u_i$.

**Suppose $j < i \leq m$.**

We know $\text{Diff}^{i-1}_L \rightarrow \text{Diff}^{i-1}_L$ from Lemma 5.2, we will use that to get that when $\text{Diff}^m_L \land \text{Set}^m_L$ then $(\text{Val}^m_B, \text{Set}^m_B) = (\text{Val}^m_L, \text{Set}^m_L)$ which allows us to then show $(\text{Set}^m_B \rightarrow (u_i \leftrightarrow \text{Val}^m_B)) \rightarrow (\text{Set}^m_L \rightarrow (u_i \leftrightarrow \text{Val}^m_L))$, When $\text{Diff}^{i-1}_L$ for $u_i \notin \text{dom}(\alpha \circ \text{restrict}_i(\xi))$ we refute $\neg \text{Diff}^{i-1}_L \land (\text{Diff}^{i-1}_R \lor \neg \text{Set}^m_B)$, $\neg \text{Diff}^{i-1}_L \land (\text{Diff}^{i-1}_R \lor (\text{Val}^m_L \leftrightarrow \text{Val}^m_B))$ , $\neg \text{Diff}^{i-1}_L \land \neg \text{Set}^m_B$ and $\neg \text{Diff}^{i-1}_L \land \text{Set}^m_B \land (\text{Diff}^{i-1}_R \lor \neg \text{Set}^m_B)$. When $\text{Diff}^{i-1}_L$ for $u_i \in \text{dom}(\xi)$ when $\text{Set}^m_B$ is true we refute $\text{Diff}^{i-1}_L \land \neg \text{Set}^m_B$ and $\neg \text{Diff}^{i-1}_L \land (\text{Diff}^{i-1}_R \lor \neg \text{Set}^m_B)$.

If $\neg \text{Set}^m_B \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$ then $u_i \notin \text{dom}(\alpha \circ \text{restrict}_i(\xi))$, also $u_i \notin \text{dom}(\alpha)$ and $u_i \notin \text{dom}(\xi)$ so $\neg \text{Set}^m_B \in \text{anno}_L(\alpha)$ And so if $L \rightarrow \text{anno}_L(\alpha)$ then $L \rightarrow \neg \text{Set}^m_B$ when $\text{Diff}^{i-1}_L$ and $u_i \notin \text{dom}(\alpha)$, $(\text{Val}^m_B, \text{Set}^m_B) = (\text{Val}^m_L, \text{Set}^m_L)$ and so $B \land L \land \text{Diff}^{i-1}_L \land \text{Set}^m_B$.

If $\text{Set}^m_B \in \text{anno}_L(\alpha \circ \text{restrict}_i(\xi))$ then $\neg u_i \in \text{dom}(\alpha \circ \text{restrict}_i(\xi))$ so either $\neg u_i \notin \alpha$ or $u_i \notin \text{dom}(\alpha)$. If $\neg u_i \in \alpha$ then $\text{Set}^m_B \in \text{anno}_L(\alpha)$ and $L \rightarrow \text{Set}^m_B$ so when $\text{Diff}^{i-1}_L \land \text{Set}^m_B$ no matter which domain $u_i$ is in $(\text{Val}^m_B, \text{Set}^m_B) = (\text{Val}^m_L, \text{Set}^m_L)$ $B \land L \land$
If $u_i \notin \text{dom}(\alpha)$ and $*/u_i \notin \xi$, $\neg Set^j_L \in \text{anno}_{L,L}(\alpha)$ so $L \rightarrow \neg Set^j_L$. $u_i \in \text{dom}(\xi)$ means that when $\text{Dif}^j_{L-1}$ and $\neg Set^j_L \in \text{Val}^j_B, Set^j_B) = (0,1)$ so $B \land L \wedge \text{Dif}^j_{L-1} \wedge Set^j_B$.

If $Set^j_B \wedge u_i \in \text{anno}_{B}(\alpha \circ \text{restrict}(\xi))$ then $1/u_i \in (\alpha \circ \text{restrict}(\xi))$ and it can only be that $1/u_i \in \alpha$ as $\xi$ can only add $*/u_i$. So $Set^j_L \wedge u_i \in \text{anno}_{L,L}(\alpha)$ and $L \rightarrow Set^j_L$, so when $\text{Dif}^j_{L-1} \wedge Set^j_L$ no matter which domain $u_i$ is in $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$. $B \land L \wedge \text{Dif}^j_{L-1} \wedge Set^j_B \wedge u_i$.

Likewise, if $Set^j_B \wedge u_i \in \text{con}_{L,B}(\alpha \circ \text{restrict}(\xi))$ then $0/u_i \in (\alpha \circ \text{restrict}(\xi))$ and it can only be that $0/u_i \in \alpha$ as $\xi$ can only add $*/u_i$. So $Set^j_L \wedge u_i \in \text{anno}_{B}(\alpha)$ and $L \rightarrow Set^j_L$. So when $\text{Dif}^j_{L-1} \wedge Set^j_L$ no matter which domain $u_i$ is in $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$. $B \land L \wedge \text{Dif}^j_{L-1} \wedge Set^j_B \wedge 

\text{Suppose } i = j.$

$\neg \text{Dif}^j_{L-1}$ by definition of $j$. $\neg \text{Dif}^j_{R-1}$ is also true as $\text{Dif}^j_{R-1}$ is necessary for $\text{Dif}^j_{L-1}$. With $\neg \text{Dif}^j_{R-1}$, $(\text{Val}^j_B, Set^j_B)$ can only be defined as $(\text{Val}^j_B, Set^j_R)$ in a small selection of circumstances. That is when: $\neg Set^j_L \land u_i \notin \text{dom}(\tau \cup \sigma \cup \xi)$, $Set^j_L \land \text{Val}^j_L$ and $1/0_j \in \tau$, $Set^j_L \land \neg \text{Val}^j_L$ and $0/0_j \in \tau$, $Set^j_L \land Set^j_R$ and $*/0_j \in \sigma$, $\neg Set^j_L$ and $*/0_j \in \xi$. All but the latter contradict $\text{Dif}^j_{L-1}$ \wedge $\neg \text{Dif}^j_{R-1}$, but we can ignore whenever $Set^j_L$ is false. So $\text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1}$ \wedge $Set^j_L \rightarrow Set^j_B$, this means that $(Set^j_B \rightarrow (u_i \leftrightarrow \text{Val}^j_B)) \rightarrow (Set^j_L \rightarrow (u_i \leftrightarrow \text{Val}^j_L))$.

If $\neg Set^j_B \in \text{anno}_{B}(\alpha \circ \text{restrict}(\xi))$ then $u_j \notin \text{dom}(\alpha \circ \text{restrict}(\xi))$ and so $u_j \notin \text{dom}(\alpha)$ $u_j \notin \text{dom}(\xi)$. So $\neg Set^j_B \in \text{anno}_{L}(\alpha)$ and $L \rightarrow \neg Set^j_B$. Since $\text{Dif}^j_L$ is true then it can only be that $u_j \in \text{dom}(\sigma)$ or $u_j \notin \text{dom}(\sigma)$. If $u_j \in \text{dom}(\tau)$ then $\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_L)$ is falsified so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \wedge \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B$. If $u_j \in \text{dom}(\sigma)$ then $\neg \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_R$ and $\neg \text{Dif}^j_{L-1}$ and $\neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_R$ are falsified so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \wedge \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B$. If $u_j \notin \text{dom}(\tau \cup \sigma \cup \xi)$ $\text{Dif}^j_{L-1}$ is false in this case so we can ignore it. $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ means that $B \land L \wedge \neg \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1}$.

If $Set^j_B \in \text{anno}_{B}(\alpha \circ \text{restrict}(\xi))$, $u_j \in \text{dom}(\alpha \circ \text{restrict}(\xi))$. Either $*/u_j \in \alpha$ or $u_j \notin \text{dom}(\alpha)$ and $*/u_j \notin \xi$. If $*/u_j \in \alpha$, then $Set^j_B \in \text{anno}_{L,L}(\alpha)$ and $L \rightarrow Set^j_B$. If $u_j \notin \text{dom}(\tau \cup \sigma \cup \xi)$, $\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_L)$ is falsified so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \land \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B$. If $u_j \in \text{dom}(\tau)$, $\text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_L$ means that $\text{Val}^j_B \land \text{Val}^j_L$. As a result $\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_L)$ is falsified so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \land \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B$. If $u_j \in \text{dom}(\sigma)$, $\neg \text{Dif}^j_{L-1}$ and $\neg \text{Dif}^j_{R-1}$, so this scenario does not occur. If $u_j \in \text{dom}(\tau)$, $\text{Dif}^j_{L-1} \land \neg \text{Set}^j_L$ is falsified by $\neg \text{Dif}^j_{L-1}$.

$\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_L)$ is falsified by $\text{Set}^j_B$ so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \land \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B$. If $u_j \not \in \text{dom}(\alpha)$ and $*/u_j \in \xi$ then $\neg \text{Set}^j_L \in \text{anno}_{L,L}(\alpha)$ and $L \rightarrow \neg \text{Set}^j_B$. However this cannot happen when $\text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1}$.

If $Set^j_B \land \text{Val}^j_B \in \text{anno}_{B}(\alpha \circ \text{restrict}(\xi))$, $1/u_j \in (\alpha \circ \text{restrict}(\xi))$. As instantiate is only done by $*$ then $1/u_j \in \alpha$. So it follows $Set^j_L \land \text{Val}^j_L \in \text{anno}_{L,L}(\alpha)$. If $u_j \notin \text{dom}(\tau \cup \sigma \cup \xi)$, $\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_L)$ is falsified so $(\text{Val}^j_B, Set^j_B) = (\text{Val}^j_L, Set^j_L)$ and $B \land L \land \text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B \land \text{Val}^j_B$. If $u_j \in \text{dom}(\tau)$, $\text{Dif}^j_{L-1} \land \neg \text{Dif}^j_{R-1} \land \neg \text{Set}^j_B \land \text{Val}^j_B$ means that $\neg \text{Val}^j_B$ and so. $\neg \text{Dif}^j_{L-1} \land (\text{Dif}^j_{R-1} \land \neg \text{Set}^j_B \land \text{Val}^j_B)$ is falsified so $(\text{Val}^j_B, Set^j_B) =
(Val^i_L, Set^i_L) and B \land L \land \text{Dif}^i_L \land \neg \text{Dif}^{i-1}_L \rightarrow \text{Set}^i_B \land \text{Val}^i_B. If u_j \in \text{dom}(\sigma), Set^j_L contradicts \text{Dif}^j_L \land \neg \text{Dif}^{j-1}_L, so this scenario does not occur. If u_j \in \text{dom}(\xi), \text{Dif}^{i-1}_L \land \neg \text{Set}^i_L is falsified by \neg \text{Dif}^{i-1}_L. \neg \text{Dif}^{i-1}_L \land (\text{Dif}^{j-1}_L \lor \neg \text{Set}^j_L) is falsified by \text{Set}^j_L so (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L) and B \land L \land \text{Dif}^i_L \land \neg \text{Dif}^{i-1}_L \rightarrow \text{Set}^i_B \land u_i.

If Set^j_B \land \neg \text{Val}^j_B \in \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)), 0/u_j \in (\alpha \circ \text{restrict}_i(\xi)). As instantiate is only done by * then 0/u_j \in \alpha. So it follows Set^j_L \land \neg \text{Val}^j_B \in \text{annol}_L(\alpha). If u_j \notin \text{dom}(\tau \cup \sigma \cup \xi), \neg \text{Dif}^{j-1}_L \land (\text{Dif}^{i-1}_L \lor \neg \text{Set}^i_L) is falsified so (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L) and B \land L \land \text{Dif}^i_L \land \neg \text{Dif}^{i-1}_L \rightarrow \text{Set}^i_B \land \neg \text{Val}^i_B. If u_j \in \text{dom}(\tau), \text{Dif}^j_L \land \neg \text{Dif}^{j-1}_L \land \text{Set}^j_B \land \neg \text{Val}^j_B means that \text{Val}^j_B and so \neg \text{Dif}^{j-1}_L \land (\text{Dif}^{i-1}_L \lor (\text{Set}^j_B \land (\text{Val}^j_B \leftrightarrow \text{Val}^j_B))) is falsified so (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L) and B \land L \land \text{Dif}^i_L \land \neg \text{Dif}^{i-1}_L \rightarrow \text{Set}^i_B \land \neg \text{Val}^i_B. If u_j \in \text{dom}(\sigma), Set^j_L contradicts \text{Dif}^j_L \land \neg \text{Dif}^{j-1}_L, so this scenario does not occur. If u_j \in \text{dom}(\xi) \text{Dif}^{j-1}_L \land \neg \text{Set}^j_L is falsified by \neg \text{Dif}^{j-1}_L. \neg \text{Dif}^{j-1}_L \land (\text{Dif}^{j-1}_L \lor \neg \text{Set}^j_L) is falsified by \text{Set}^j_L so (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L) and B \land L \land \text{Dif}^i_L \land \neg \text{Dif}^{i-1}_L \rightarrow \text{Set}^i_B \land \neg u_i.

**Suppose** i < j.

In this case \neg \text{Dif}^{j-1}_L, \neg \text{Dif}^{j-1}_R, \neg \text{Dif}^{j-1}_R are all true. We can see from Lemma 5.5 that Set^j_L \rightarrow \text{Set}^i_B in all cases. We observe all the cases when Set^j_L is true and Val^j_B is not defined as Val^i_L. For u_i \in \text{dom}(\sigma), this happens if (Val^j_B \leftrightarrow Val^i_B), but then also (Val^j_B \leftrightarrow Val^i_B) if \neg \text{Dif}^i_L so Val^i_B = Val^i_L = Val^j_B. For u_i \in \text{dom}(\sigma), if \neg \text{Dif}^{i-1}_L \land \text{Set}^j_B \land \neg \text{Dif}^{j-1}_R then Val^j_B = Val^j_R, but this cannot happen if \neg \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R. So in all cases of \neg \text{Dif}^{j-1}_L, \neg \text{Dif}^{j-1}_R, \neg \text{Dif}^{j-1}_R, Set^j_L we have Val^j_B = Val^i_B. This means that Set^j_B \rightarrow (u_i \leftrightarrow Val^j_B) \rightarrow (u_i \leftrightarrow Val^i_B).

If \neg \text{Set}^i_B \in \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)) then u_j \notin \text{dom}(\alpha \circ \text{restrict}_i(\xi)) and so u_j \notin \text{dom}(\alpha). u_j \notin \text{dom}(\xi). So \neg \text{Set}^i_L \in \text{annol}_L(\alpha) and L \rightarrow \neg \text{Set}^i_B. \neg \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \land \text{Set}^j_B \land \neg \text{Val}^j_B. So B \land L \land \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \land \neg \text{Dif}^{j-1}_R \rightarrow \neg \text{Set}^j_B.

If Set^j_B \in \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)). Either */u_i \in \alpha or u_i \notin \text{dom}(\alpha) and */u_i \in \xi. If */u_i \in \alpha, then Set^j_B \in \text{annol}_L(\alpha) and L \rightarrow \text{Set}^j_L. By Lemma 5.5, u_i must be in \text{dom}(\tau) or \text{dom}(\sigma). In either case Set^j_B is true. So B \land L \land \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \rightarrow \text{Set}^j_B. If u_i \notin \text{dom}(\alpha) and */u_i \in \xi, then \neg \text{Set}^j_L \in \text{annol}_L(\alpha) and L \rightarrow \neg \text{Set}^j_L. By Lemma 5.5, Set^j_B is true. So B \land L \land \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \land \neg \text{Set}^j_B.

If Set^j_B \land \text{Val}^j_B \in \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)) then 1/u_i \in \alpha \circ \text{restrict}_i(\xi), so it must be that 1/u_i \in \alpha. And so Set^j_L \land \text{Val}^j_B \in \text{annol}_L(\alpha) By Lemma 5.5, u_i must be in \text{dom}(\tau) or \text{dom}(\sigma). In either case (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L). So B \land L \land \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \land \neg \text{Dif}^{j-1}_R \land \text{Val}^j_B \land \neg \text{Val}^j_B. Because L \rightarrow \text{Set}^j_L \land \neg \text{Val}^j_B.

Likewise, if Set^j_B \land \neg \text{Val}^j_B \in \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)) then 0/u_i \in \alpha \circ \text{restrict}_i(\xi), so it must be that 0/u_i \in \alpha. And so Set^j_L \land \neg \text{Val}^j_B \in \text{annol}_L(\alpha). By Lemma 5.5, u_i must be in \text{dom}(\tau) or \text{dom}(\sigma). In either case (Val^j_B, Set^j_B) = (Val^i_L, Set^i_L). So B \land L \land \text{Dif}^{j-1}_L \land \neg \text{Dif}^{j-1}_R \land \neg \text{Dif}^{j-1}_R \land \neg \text{Val}^j_B \land \neg \text{Val}^j_B. Because L \rightarrow \text{Set}^j_L \land \neg \text{Val}^j_B.

In all \text{Dif}^{p_n}_L cases (Set^j_B \rightarrow (u_i \leftrightarrow \text{Val}^j_B)) \rightarrow (Set^i_L \rightarrow (u_i \leftrightarrow \text{Val}^i_B)) so then B \land \text{Dif}^{p_n}_L \rightarrow L. We also have B \land \text{Dif}^{p_n}_L \land \neg \text{annol}_B(\alpha \circ \text{restrict}_i(\xi)). We also get B \land \text{Dif}^{p_n}_L \land \neg \text{con}_B(l). From L \rightarrow l so we can get B \land \text{Dif}^{p_n}_L \land \neg \text{annol}_B(\alpha \circ \text{restrict}_i(\xi), l_0), this can be put in a disjunction B \land \text{Dif}^{p_n}_L \land \neg \text{con}_B(\text{inst}(\xi, C_1)), when L \rightarrow \text{con}_L(C_1) instead of L \rightarrow \text{con}_L(l_0). This is simplified to B \land \text{Dif}^{p_n}_L \rightarrow \text{con}_B(\text{inst}(\xi, C_1)) as B \land \text{Dif}^{p_n}_L \rightarrow L.
Now we argue that \((R \rightarrow \text{con}_R(l^\alpha))\) implies \((B \land \neg\text{Dif}_L \land \neg\text{Dif}_R^m) \rightarrow \text{con}_R(l^\alpha \circ \mathit{restrict}_i(\sigma))\).

**Suppose** \(i > m\).

\(\text{Dif}_L \land \text{Dif}_R^m\) satisfies \(\neg\text{Dif}_L \land (\text{Dif}_R^m \lor \neg \alpha)\) so \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) in all cases. This means that \((\text{Set}_B^i \rightarrow (\text{Val}_B^i \leftrightarrow u_i)) \rightarrow (\text{Set}_R^i \rightarrow (\text{Val}_R^i \leftrightarrow u_i)).\)

If \(-\text{Set}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(u_i \notin \text{dom}(\alpha)\) and \(u_i \notin \text{dom}(\sigma)\) then \(-\text{Set}_R^i \in \text{con}_i.R(\alpha)\) so \(R \rightarrow \neg\text{Set}_R^i\) and so \(B \land R \land \neg\text{Set}_R^i \land \neg\text{Dif}_L \land \neg\text{Dif}_R^m \rightarrow \neg\text{Set}_R^i\).

If \(\text{Set}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(u_i \in \text{dom}(\alpha) \circ \mathit{restrict}_i(\sigma))\). Which means either \(u_i \in \text{dom}(\alpha)\) or \(u_i \notin \text{dom}(\alpha)\) and \(u_i \in \sigma\). But \(u_i \notin \sigma\) because \(i > m\). Since \(u_i \in \text{dom}(\alpha)\), \(\text{Set}_R^i \in \text{con}_i.R(\alpha)\) and so \(B \land R \land \neg\text{Set}_R^i \land \neg\text{Dif}_L \land \neg\text{Dif}_R^m \rightarrow \text{Set}_B^i\).

If \(\text{Set}_B^i \land \text{Val}_B^i \land \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(1/ u_i \in \alpha \circ \sigma\). Which means \(1/ u_i \in \alpha\). \(\text{Set}_R^i \land \text{Val}_R^i \land \text{con}_i.R(\alpha)\) and so \(B \land R \land \text{Set}_R^i \land \text{Val}_R^i \land \neg\text{Dif}_L \land \neg\text{Dif}_R^m \rightarrow \text{Set}_B^i \land u_i\).

If \(\text{Set}_B^i \land \text{Val}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(\neg\text{Set}_R^i \in \text{dom}(\alpha)\) and \(u_i \notin \text{dom}(\sigma)\) then \(-\text{Set}_R^i \in \text{con}_i.R(\alpha)\) so \(R \rightarrow \neg\text{Set}_R^i\). When \(-\text{Dif}_L \land \text{Dif}_R^{-1} \land u_i \notin \text{dom}(\sigma)\) then \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) whenever \(\text{Set}_R^i\) is true. This means that \((\text{Set}_B^i \rightarrow (\text{Val}_B^i \leftrightarrow u_i)) \rightarrow (\text{Set}_R^i \rightarrow (\text{Val}_R^i \leftrightarrow u_i)).\)

If \(-\text{Set}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(*/ u_i \notin \alpha \circ \sigma\). So either \(*/ u_i \in \alpha\) or \(*/ u_i \in \sigma\) and \(u_i \notin \text{dom}(\alpha)\). If \(*/ u_i \in \alpha\) then \(\text{Set}_R^i \in \text{con}_i.R(\alpha)\) and when \(\text{Set}_R^i\) is true then \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) so \(R \rightarrow \text{Set}_B^i\) implies \(B \land \neg\text{Dif}_L \land \land \text{Dif}_R^i \land \neg\text{Dif}_R^m \land \text{Set}_R^i \rightarrow \text{Set}_B^i\). If \(*/ u_i \in \sigma\) and \(u_i \notin \text{dom}(\alpha)\), \(-\text{Set}_R^i \in \text{con}_i.R(\alpha)\) and \(-\text{Dif}_L \land \text{Dif}_R^{-1} \land \neg\text{Set}_R^i\) is satisfied so \((\text{Val}_B^i, \text{Set}_B^i)=(0, 1)\) therefore \(B \land \neg\text{Dif}_L \land \land \text{Dif}_R^i \land \text{Dif}_R^m \land \text{Set}_R^i \rightarrow \text{Set}_B^i\).

If \(\text{Set}_B^i \land \text{Val}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(1/ u_i \in \alpha \circ \sigma\), and it must be that \(1/ u_i \in \alpha\) and so \(\text{Set}_R^i \land \text{Val}_R^i \in \text{con}_i.R(\alpha)\) and when \(\text{Set}_R^i\) is true then \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) so \(R \rightarrow \text{Set}_R^i \land u_i\) implies \(B \land \neg\text{Dif}_L \land \land \text{Dif}_R^i \land \text{Dif}_R^m \land \text{Set}_R^i \rightarrow \text{Set}_B^i \land u_i\).

If \(\text{Set}_B^i \land \neg\text{Val}_B^i \in \text{con}_i.B(\alpha \circ \mathit{restrict}_i(\sigma))\) then \(0/ u_i \in \alpha \circ \sigma\) and it must be that \(0/ u_i \in \alpha\) and so \(\text{Set}_R^i \land \text{Val}_R^i \in \text{con}_i.R(\alpha)\) and when \(\text{Set}_R^i\) is true then \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) so \(R \rightarrow \text{Set}_R^i \land u_i\) implies \(B \land \neg\text{Dif}_L \land \land \text{Dif}_R^i \land \text{Dif}_R^m \land \text{Set}_R^i \rightarrow \text{Set}_B^i \land u_i\).

**Suppose** \(i = j\).

In this case \(-\text{Dif}_L^{-1}, \neg\text{Dif}_L^i, \neg\text{Dif}_R^{-1} \land \text{Dif}_R^j\). If \(\text{Set}_R^j\) then either \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_R^i, \text{Set}_R^i)\) or \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_L^i, \text{Set}_L^i)\). We will argue that \((\text{Val}_B^i, \text{Set}_B^i)=((\text{Val}_L^i, \text{Set}_L^i)\) is not chosen because of \(-\text{Dif}_L^i\) and \(\neg\text{Eq}_R\) \(-\text{Dif}_L^{-1} \land (\text{Dif}_R^{-1} \lor \neg\text{Set}_L^i)\) cannot be falsified because \(\text{Set}_L^i\) being true would contradict \(\neg\text{Dif}_L^i\). Likewise \(-\text{Dif}_L^{-1} \land (\text{Dif}_R^{-1} \lor (\text{Val}_L^i \leftrightarrow \text{Val}_L^i))\) cannot be falsified as \((\text{Set}_L^i \land (\text{Val}_L^i \leftrightarrow \text{Val}_L^i))\) being false would contradict \(\neg\text{Dif}_L^i\). If \(u_i \in \text{dom}(\sigma)\) then \(-\text{Dif}_L^{-1} \land \neg\text{Dif}_R^{-1} \land \text{Set}_R^i\) is false and \(-\text{Dif}_L^{-1} \land \text{Set}_R^i \land (\text{Dif}_R^{-1} \lor \text{Set}_L^i)\) is true. Likewise if
If \( u_i \in \text{dom}(\xi) \) then \( \text{Diff}^{-1}_L \wedge \neg \text{Set}^i_L \) is false and \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee \neg \text{Set}^i_L) \) is true. The result is that \((\text{Set}^i_B \rightarrow (\text{Val}^i_B \leftrightarrow u_i)) \rightarrow (\text{Set}^i_R \rightarrow (\text{Val}^i_R \leftrightarrow u_i)) \).

If \( \neg \text{Set}^i_B \in \text{con}_L(B(\alpha \circ \text{restrict}(\sigma))) \) then \( u_i \notin \text{dom}(\alpha \circ \sigma) \), which means \( u_i \notin \text{dom}(\alpha) \) and \( u_i \notin \text{dom}(\sigma) \). So \( \neg \text{Set}^i_R \in \text{con}_R(\alpha) \) and thus \( R \rightarrow \neg \text{Set}^i_R \). If \( u_i \in \text{dom}(\tau) \) we argue that \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee (\text{Set}^i_L \wedge (\text{Val}^i_L \rightarrow \neg \text{Val}^i_B))) \) is satisfied because of \( \neg \text{Diff}^{-1}_L \). Hence \((\text{Val}^i_B, \text{Set}^i_B)=(\text{Val}^i_R, \text{Set}^i_R) \) and so \( B \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \text{Diff}^1_R \wedge \text{Set}^i_L \rightarrow \neg \text{Set}^i_B \).

If \( u_j \in \text{dom}(\xi) \), we argue that \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee \neg \text{Set}^i_L) \) is satisfied because of \( \neg \text{Diff}^{-1}_L \). Hence \((\text{Val}^i_B, \text{Set}^i_B)=(\text{Val}^i_R, \text{Set}^i_R) \) and so \( B \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \text{Diff}^1_R \wedge \text{Set}^i_L \rightarrow \neg \text{Set}^i_B \).

If \( \neg \text{Set}^i_B \in \text{con}_L(B(\alpha \circ \text{restrict}(\sigma))) \) then \( u_j \notin \text{dom}(\alpha \circ \sigma) \). So either \( u_j \notin \text{dom}(\alpha) \) or \( u_j \notin \text{dom}(\sigma) \). If \( \neg \text{Set}^i_R \in \text{con}_R(\alpha) \) and \( R \rightarrow \neg \text{Set}^i_R \). When \( \text{Set}^i_R \) is true we know \((\text{Val}^i_B, \text{Set}^i_B)=(\text{Val}^i_R, \text{Set}^i_R) \) and so \( B \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \text{Diff}^1_R \wedge \text{Set}^i_L \rightarrow \neg \text{Set}^i_B \).

If \( \text{Set}^i_B \wedge \text{Val}^i_B \in \text{con}_L(B(\alpha \circ \text{restrict}(\sigma))) \), so \( 0/u_j \in (\alpha \circ \sigma) \). So it must be that \( 0/u_j \in \alpha \). And so \( \text{Set}^i_R \wedge \text{Val}^i_R \in \text{con}_R(\alpha) \) and thus \( R \rightarrow \neg \text{Set}^i_R \) since \( \text{Set}^i_R \) is true we know that \((\text{Val}^i_B, \text{Set}^i_B)=(\text{Val}^i_R, \text{Set}^i_R) \) and so \( B \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \text{Diff}^1_R \wedge \text{Set}^i_L \rightarrow \neg \text{Set}^i_B \wedge \text{Val}^i_B \).

If \( \text{Set}^i_B \wedge \neg \text{Val}^i_B \in \text{con}_L(B(\alpha \circ \text{restrict}(\sigma))) \), so \( 0/u_j \in (\alpha \circ \sigma) \). So it must be that \( 0/u_j \in \alpha \). And so \( \text{Set}^i_R \wedge \neg \text{Val}^i_R \in \text{con}_R(\alpha) \) and thus \( R \rightarrow \neg \text{Set}^i_R \) since \( \text{Set}^i_R \) is true we know that \((\text{Val}^i_B, \text{Set}^i_B)=(\text{Val}^i_R, \text{Set}^i_R) \) and so \( B \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \text{Diff}^1_R \wedge \text{Set}^i_L \rightarrow \neg \text{Set}^i_B \wedge \text{Val}^i_B \).

Suppose \( i < j \).

In this case \( \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \neg \text{Diff}^{-1}_L \rightarrow \neg \text{Diff}^{-1}_R \) are all true. We can see from Lemma 5.5 that \( \text{Set}^i_R \rightarrow \text{Set}^i_B \) in all cases. We observe all the cases when \( \text{Set}^i_R \) is true and \( \text{Val}^i_B \) is not defined as \( \text{Val}^i_R \) and show they cannot happen.

For \( u_i \notin \text{dom}(\tau \cup \sigma \cup \xi) \), if \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee \neg \text{Set}^i_L) \) is false then \( \text{Set}^i_L \) must be true, but this conflicts with \( \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_L \). For \( u_i \in \text{dom}(\tau) \) if \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee (\text{Set}^i_L \wedge (\text{Val}^i_L \rightarrow \neg \text{Val}^i_B))) \) is false then \( \text{Set}^i_L \rightarrow (\text{Val}^i_L \oplus \text{Val}^i_R) \) is contradicting \( \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_L \). For \( u_i \in \text{dom}(\sigma) \) if \( \neg \text{Diff}^{-1}_L \wedge \neg \text{Set}^i_R \wedge (\text{Diff}^{-1}_R \vee \text{Set}^i_L) \) is false the then \( \text{Set}^i_L \) is false contradicting \( \neg \text{Diff}^{-1}_L \). For \( u_i \in \text{dom}(\xi) \) if \( \neg \text{Diff}^{-1}_L \wedge (\text{Diff}^{-1}_R \vee \neg \text{Set}^i_L) \) is false then \( \text{Set}^i_L \) is true but in \( \text{dom}(\xi) \) this contradicts \( \neg \text{Diff}^{-1}_L \). Therefore \((\text{Set}^i_B \rightarrow (\text{Val}^i_B \leftrightarrow u_i)) \rightarrow (\text{Set}^i_R \rightarrow (\text{Val}^i_R \leftrightarrow u_i)) \).

If \( \neg \text{Set}^i_B \in \text{con}_L(B(\alpha \circ \text{restrict}(\sigma))) \) then \( u_j \notin \text{dom}(\alpha \circ \sigma) \) and so \( u_j \notin \text{dom}(\alpha) \) and \( u_j \notin \text{dom}(\sigma) \). So \( \neg \text{Set}^i_R \in \text{con}_R(\alpha) \) and \( R \rightarrow \neg \text{Set}^i_R \). \( \neg \text{Set}^i_R \wedge \neg \text{Diff}^{-1}_L \) means that \( u_i \notin \text{dom}(\tau \cup \sigma \cup \xi) \). From Lemma 5.5 we know \( \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \wedge \neg \text{Set}^i_L \). So \( B \wedge R \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \rightarrow \neg \text{Set}^i_B \). If \( \text{Set}^i_B \in \text{con}_B(\alpha \circ \text{restrict}(\sigma)) \). Either \( u_i \in \alpha \) or \( u_i \notin \text{dom}(\alpha) \) and \( u_j \in \text{dom}(\alpha) \). If \( u_i \in \text{dom}(\alpha) \) and \( u_j \in \alpha \), then \( \text{Set}^i_R \in \text{con}_R(\alpha) \) and \( R \rightarrow \neg \text{Set}^i_R \). By Lemma 5.5, \( u_i \) must be in \( \text{dom}(\tau) \) or \( \text{dom}(\xi) \). In either case \( \text{Set}^i_B \) is true. So \( B \wedge R \wedge \neg \text{Diff}^{-1}_L \wedge \neg \text{Diff}^{-1}_R \rightarrow \text{Set}^i_B \) if \( u_i \notin \text{dom}(\alpha) \) and \( u_j \notin \alpha \), then \( \neg \text{Set}^i_R \in \text{con}_R(\alpha) \) and \( R \rightarrow \neg \text{Set}^i_R \). By Lemma 5.5, \( \text{Set}^i_R \) is true. So \( B \wedge R \wedge \text{Diff}^{-1}_R \wedge \neg \text{Diff}^{-1}_L \rightarrow \text{Set}^i_B \).
If $\text{Set}^i_B \land \text{Val}^i_B \in \text{con}_B(\alpha \circ \text{restrict}(\sigma))$ then $1/u_i \in \alpha \circ \sigma$, so it must be that $1/u_i \in \alpha$. And so $\text{Set}^i_R \land \text{Val}^i_R \in \text{con}_R(\alpha)$. By Lemma 5.5, $u_i$ must be in $\text{dom}(\tau)$ or $\text{dom}(\xi)$. In either case $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_R, \text{Set}^i_R)$. So $B \land R \land \text{Diff}^i_L \land \neg \text{Diff}^i_R \rightarrow \text{Set}^i_B \land \text{Val}^i_B$, because $R \rightarrow \text{Set}^i_R \land \text{Val}^i_R$.

Likewise, if $\text{Set}^i_L \land \neg u_i \in \text{con}_B(\alpha \circ \text{restrict}(\sigma))$ then $0/u_i \in \alpha \circ \sigma$, so it must be that $0/u_i \in \alpha$. And so $\text{Set}^i_R \land \text{Val}^i_R \in \text{con}_R(\alpha)$. By Lemma 5.5, $u_i$ must be in $\text{dom}(\tau)$ or $\text{dom}(\xi)$. In either case $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_R, \text{Set}^i_R)$. So $B \land R \land \text{Diff}^i_L \land \neg \text{Diff}^i_R \rightarrow \text{Set}^i_B \land \neg u_i$, because $R \rightarrow \text{Set}^i_R \land \neg u_i$. With that we conclude all cases in $R$ and argue similarly to $L$. □

A.2. Local Strategy Extraction for Simulation of $\text{LQU}^+\text{-Res}$.

A.2.1. Policy Variables. For $u_i^* \notin C_1 \cup C_2$, $i \leq m$

$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (\text{Val}^i_L, \text{Set}^i_L) & \text{if } \neg \text{Diff}^{i-1}_L \land (\text{Diff}^{i-1}_R \lor \neg \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$

For $u_i^* \in C_1$, $i \leq m$

$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (0, 1) & \text{if } \neg \text{Diff}^{i-1}_L \land \neg \text{Diff}^{i-1}_R \land \neg \text{Set}^i_L \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } \neg \text{Diff}^{i-1}_L \land \text{Set}^i_R \land (\text{Diff}^{i-1}_R \lor \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$

For $u_i^* \in C_2$, $i \leq m$

$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (0, 1) & \text{if } \text{Diff}^{i-1}_L \land \neg \text{Set}^i_L \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } \neg \text{Diff}^{i-1}_L \land (\text{Diff}^{i-1}_R \lor \neg \text{Set}^i_L) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{otherwise.} \end{cases}$

For $u_i \in \text{dom}(U^+)$, $i > m$

$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (\text{Val}^i_L, \text{Set}^i_L) & \text{if } \text{Set}^i_R \land \neg \text{Diff}^m_L \land (\text{Diff}^m_R \lor \neg x) \\ (0, 1) & \text{if } u_i \in U_2 \land \neg \text{Set}^i_R \land \neg \text{Diff}^m_L \land (\text{Diff}^m_R \lor \neg x) \\ (1, 1) & \text{if } u_i \in U_2 \land \neg \text{Set}^i_R \land \neg \text{Diff}^m_L \land (\text{Diff}^m_R \lor \neg x) \\ (1, 1) & \text{if } u_i^* \in U_2 \land \neg \text{Set}^i_R \land \neg \text{Diff}^m_L \land (\text{Diff}^m_R \lor \neg x) \\ (0, 1) & \text{if } u_i \in U_1 \land \neg \text{Set}^i_L \land (\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)) \\ (1, 1) & \text{if } u_i \in U_1 \land \neg \text{Set}^i_L \land (\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)) \\ (0, 1) & \text{if } u_i^* \in U_1 \land \neg \text{Set}^i_L \land (\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)) \end{cases}$

For $u_i \notin \text{dom}(U)$, $i > m$

$(\text{Val}^i_B, \text{Set}^i_B) = \begin{cases} (0, 1) & \text{if } u^* \in V_2 \land \neg \text{Set}^i_L \land (\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \in V_2 \land \text{Set}^i_L \land (\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \in V_2 \land \neg \text{Diff}^m_R \land (\text{Diff}^m_L \lor \neg x) \\ (0, 1) & \text{if } u^* \in V_1 \land \neg \text{Set}^i_R \land (\neg \text{Diff}^m_R \land (\text{Diff}^m_L \lor \neg x)) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \in V_1 \land \text{Set}^i_R \land (\neg \text{Diff}^m_R \land (\text{Diff}^m_L \lor \neg x)) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \in V_1 \land \text{Diff}^m_R \lor (\neg \text{Diff}^m_L \land x) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \notin V_1 \cup V_2 \land \neg \text{Diff}^m_R \land (\text{Diff}^m_L \lor \neg x) \\ (\text{Val}^i_L, \text{Set}^i_L) & \text{if } u^* \notin V_1 \cup V_2 \land \text{Diff}^m_R \lor (\neg \text{Diff}^m_L \land x) \end{cases}$
Lemma 6.6. The following propositions are true and have short Extended Frege proofs, given $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x))$ and $(R \rightarrow \text{con}_R(C_2 \cup U_2 \vee x))$:

- $B \land \text{Diff}^m_L \rightarrow L$
- $B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow R$
- $B \land \text{Diff}^m_R \rightarrow \text{con}_B(C_1 \vee V_2 \vee U)$
- $B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow \text{con}_B(C_2 \vee V_1 \vee U)$

Proof. We break $B \land \text{Diff}^m_L \rightarrow L$ into individual parts $\text{Set}^i_B \rightarrow (u_i \leftrightarrow \text{Val}^i_B) \land \text{Diff}^m_L \rightarrow (\text{Set}^i_L \rightarrow (u_i \leftrightarrow \text{Val}^i_L))$ which we join by conjunction. We can do similarly for $B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow R$.

For $B \land \text{Diff}^m_L \rightarrow \text{con}_B(C_1 \vee V_2 \vee U^*)$ we first derive $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x)) \rightarrow (B \land L \land \text{Diff}^m_L \rightarrow \text{con}_B(C_1 \vee V_2 \vee U^*))$, you can cut out $L$ using $B \land \text{Diff}^m_L \rightarrow L$. Removing $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x))$, uses the premise $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x))$.

To derive $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x)) \rightarrow (B \land L \land \text{Diff}^m_L \rightarrow \text{con}_B(C_1 \vee V_2 \vee U^*))$ we break this by non-starred literals $l \in C_1 \cup U_1$ so we will show that $(L \rightarrow \text{con}_L(C_1 \cup U_1 \vee \neg x)) \rightarrow (B \land \text{Diff}^m_L \rightarrow \text{con}_B(V_1 \cup \text{Set}^i_L(l)))$. $\text{Diff}^m_L \rightarrow \neg \text{anno}_{x,L}(V_1)$ is used to remove the $x$ literal.

For $p \in \{1, 2\}$ let $W_p = \{u^* \mid u^* \in U_p\}$. For each $i$, either $\text{Set}^i_B$ or $\neg \text{Set}^i_B$ appears in $\text{anno}_L(B(V_1 \cup V_2 \cup U^*))$ so we treat $\text{anno}_L(B(V_1 \cup V_2 \cup U^*))$ as a set containing these subformulas. We show that if $c_i \in \text{anno}_L(B(V_1 \cup V_2 \cup U^*))$ when $c_i = \text{Set}^i_B$ or $c_i = \neg \text{Set}^i_B$ then $L \rightarrow \text{anno}_{x,L}(V_1 \cup U_1) \rightarrow B \land \text{Diff}^m_L \rightarrow c_i$ and we also have $(L \rightarrow l) \rightarrow (B \land \text{Diff}^m_L \rightarrow l)$. For existential literals we can put these all together to get $L \rightarrow \text{con}_L(C_1 \cup U_1 \vee l) \rightarrow (B \land L \land \text{Diff}^m_L \rightarrow \text{con}_B(V_1 \cup \text{Set}^i_L(l)))$.

For universal literals $u_k$ also need to show $\neg \text{Set}^k_B$ is preserved when $u_k$ is not merged. For universal literals $u_k$ that are merged $\text{con}_B(V_1 \cup V_2 \cup U^*) = \bot$ so we show that the strategy for $B$ causes a contradiction between $B$ and $L \rightarrow u_k$. We do similarly for $B \land \neg \text{Diff}^m_L \land \text{Diff}^m_R \rightarrow \text{con}_B(C_2 \vee V_1 \vee U^*)$.

**The Diff^m\_L cases.** If $\text{Diff}^m_L$ is true then there is some $j$ such that $\text{Diff}^j_L \land \neg \text{Diff}^j_R \land \neg \text{Diff}^j_R$ via Lemmas 6.2 and 6.3. We use the disjunction $\text{Diff}^m_L \rightarrow \bigvee_{j=1}^m \text{Diff}^j_L \land \neg \text{Diff}^{j-1}_L$ to join all the cases of $j$ together.

**Suppose** $i > m$.

$\text{Diff}^i_L$ satisfies $\text{Diff}^m_L \lor (\neg \text{Diff}^m_R \land x)$ so whenever $\text{Diff}^m_L$ is true and $\text{Set}^i_L$ is true, $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$, therefore $(\text{Set}^i_B \rightarrow (u_i \leftrightarrow \text{Val}^i_B)) \rightarrow (\text{Set}^i_L \rightarrow (u_i \leftrightarrow \text{Val}^i_L))$.

If $\text{Set}^i_B \in \text{anno}_x,B(V_1 \cup V_2 \cup U^*)$, either $u_i^* \in V_1$, $u_i^* \in V_2$ or $u_i^* \in U^*$. If $u_i^* \in V_2$ then every possibility we have $\text{Set}^i_B$ be true. If $u_i^* \in V_1$ we know $\text{Set}^i_B$ will be true since it is assumed to be implied by $L$, hence $\text{Set}^i_B = \text{Set}^i_L$ suffices. If $u_i^* \in U^*$ every case $\text{Set}^i_B$ is true when $\text{anno}_{x,L}(V_1 \cup U_1)$ is affirmed by $L$.

If $\neg \text{Set}^i_B \in \text{anno}_x,B(V_1 \cup V_2 \cup U^*)$ then $u_i^* \notin V_1 \cup V_2 \cup U^*$, this means that $u_i^* \notin W_1$, so whenever $\text{anno}_{x,L}(V_1 \cup U_1)$ is true, $\neg \text{Set}^i_L$. But then $\neg \text{Set}^i_B$ must be true because of $\text{Diff}^m_L$.

**Suppose** $j < i \leq m$.

We know $\text{Diff}^i_L \rightarrow \text{Diff}^{i-1}_L$ from Lemma 6.3, we will use this to get that when $\text{Diff}^j_L \land \text{Set}^i_L$ then $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$ which allows us to then show $(\text{Set}^i_B \rightarrow (u_i \leftrightarrow \text{Val}^i_B)) \rightarrow (\text{Set}^i_L \rightarrow (u_i \leftrightarrow \text{Val}^i_L))$.

Suppose $\neg \text{Set}^i_B \in \text{anno}_x,B(V_1 \cup V_2 \cup U^*)$, then $u_i^* \notin C_1 \cup C_2$ so $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$.

But since $\text{Set}^i_L$ will be false because $u_i^* \notin C_1$, $\text{Set}^i_B$ will be false.

Now suppose $\text{Set}^i_B \in \text{anno}_x,B(V_1 \cup V_2 \cup U^*)$, either $u_i^* \in C_1$, in which case $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$, or $u_i^* \in C_2$, in which case $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$ or $\neg \text{Set}^i_L$, but here we know $\text{Set}^i_B$ will be forced to be true, regardless.
Suppose $i = j$.

$\text{Diff}^i_L, \neg \text{Diff}^i_L$ and $\neg \text{Diff}^i_R$ are all true. If $\text{Set}^i_L \in \text{anno}_x, L(V_1 \cup W_1)$ then $\neg \text{Set}^i_L$ and if $\neg \text{Set}^i_L \in \text{anno}_x, L(V_1 \cup W_1)$ then $\text{Set}^i_L$.

If $\text{Set}^i_L \in \text{anno}_x, L(V_1 \cup W_1)$ and $\neg \text{Set}^i_L$ then $u^*_i \in C_1$ and so $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$.

So if $\text{anno}_x, L(V_1 \cup W_1)$ is satisfied by $L$ the term $\text{Set}^i_R \in \text{anno}_x, L(V_1 \cup W_1 \cup U^*)$ is satisfied by $B$.

If $\neg \text{Set}^i_L \in \text{anno}_x, L(V_1 \cup W_1)$ and $\text{Set}^i_L$ then if $u^*_i \in C_2$, we know $\text{Set}^i_B \in \text{anno}_x, L(V_1 \cup V_2 \cup U^*)$, since $\text{Set}^i_L$ is true then $\text{Set}^i_B$ is true.

If $u^*_i \not\in C_1 \cup C_2$ then $\neg \text{Set}^i_B \in \text{anno}_x, B(V_1 \cup V_2 \cup U^*)$, but then $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_L, \text{Set}^i_L)$.

So if $\text{anno}_x, L(V_1 \cup W_1)$ is satisfied by $L$ the term $\text{Set}^i_B \in \text{anno}_x, L(V_1 \cup V_2 \cup U^*)$ is satisfied by $B$.

Suppose $i < j$.

If $\neg \text{Set}^i_B \in \text{anno}_x, B(V_1 \cup V_2 \cup U^*)$ then $u^*_i \not\in C_1 \cup C_2$ and so by Lemma 6.5 $\neg \text{Set}^i_B$ is true. If $\text{Set}^i_B \in \text{anno}_x, B(V_1 \cup V_2 \cup U^*)$ then $u^*_i \in C_1 \cup C_2$ and so by Lemma 6.5, $\text{Set}^i_B$ is true.

We can put this all together to show in eFrege that $B \land \text{Diff}^m_R \rightarrow L, L \rightarrow \text{con}_{L,C_1 \cup U_1 \cup C_2}(l) \rightarrow B \land L \land \text{Diff}^m_R \rightarrow \text{con}_{B,C_2 \cup U_2 \cup U^*}(l)$, for existential literal $l$. Note that $\text{Diff}^i_R$ means that $\text{con}_{R,C_2 \cup U_2 \cup V, R}(\neg x)$ is not satisfied by $L$ to begin with.

**Additional universal consideration.**

If $l = u_k$, then when $l$ does not become merged we also have to show that $\neg \text{Set}^k_B$ is preserved when $\text{con}_{L,C_1 \cup U_1 \cup C_2}(l)$ and $\text{Diff}^m_R$. Note that if $\text{Diff}^i_R$ then the annotation is contradicted. If $u_k \in C_1 \lor C_2$ or $\neg u_k \in C_1 \lor C_2$, for $i \leq m$ then $\neg \text{Set}^i_B$ is desired, but $\text{Set}^i_B$ will only happen when forced by $\text{Set}^i_B$ being true, but this would mean $\text{Diff}^i_R$ and $\neg \text{Diff}^i_L$, which would contradict $\text{Diff}^m_R$. If $u_k \in C_1 \lor C_2$ or $\neg u_k \in C_1 \lor C_2$ for $i > m$ then $\text{Diff}^m_R$ will contradict an annotation. $u_k \in U_1$ then the literal will not appear as such in $\text{con}_{L,C_1 \cup C_2 \cup U^*}$ because it will now only count as a starred literal.

We have to show any universal literal $l = u_k$ or $l = \neg u_k$ that does become merged, can be removed from the disjunction. In essence we need to prove $(L \rightarrow \text{con}_{L,C_1 \cup U_1}(l)) \rightarrow (B \land L \land \text{Diff}^m_R \rightarrow \bot)$. The essential part is that $\text{con}_{L,C_1 \cup U_1}(l)$ contains $l$ but also contains $\text{Set}^i_B$ which in turn guarantees $\text{Set}^k_B$ and forces $\text{Val}^k_B$ to be the opposite value of $l$.

**The $\text{Diff}^m_R \land \neg \text{Diff}^m_R$ cases.**

If $\text{Diff}^m_R$ is true then there is some $j$ such that $\text{Diff}^j_R \land \neg \text{Diff}^j_R \land \neg \text{Diff}^j_R$ via Lemmas 6.2 and 6.3. We use the disjunction $\text{Diff}^m_R \rightarrow \bigvee_{j=1}^m \text{Diff}^j_R \land \neg \text{Diff}^j_R$ to join all the cases of $j$ together.

**Suppose $i > m$.**

$\text{Diff}^m_R \land \neg \text{Diff}^m_R$ satisfies $\neg \text{Diff}^m_R \land (\text{Diff}^m_R \lor \neg x)$ so whenever $\text{Diff}^m_R \land \neg \text{Diff}^m_R$ is true and $\text{Set}^i_R$ is true $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_R, \text{Set}^i_R)$, therefore $(\text{Set}^i_B \rightarrow (u_i \leftrightarrow \text{Val}^i_B)) \rightarrow (\text{Set}^i_R \rightarrow (u_i \leftrightarrow \text{Val}^i_R))$.

If $\text{Set}^i_B \in \text{anno}_x, B(V_1 \cup V_2 \cup U^*)$, then $u^*_i \in V_1$, $u^*_i \in V_2$ or $u^*_i \in U^*$. In every case $\text{Set}^i_B$ is true when $\text{anno}_x, B(V_2 \cup W_2)$ is affirmed by $R$ and $\text{Diff}^m_R \land \neg \text{Diff}^m_R$ is true.

If $\neg \text{Set}^i_B \in \text{anno}_x, B(V_1 \cup V_2 \cup U^*)$ then $u^*_i \not\in U$, this means that $u^*_i \not\in W_2$, so whenever $\text{anno}_x, R(V_2 \cup W_2)$ is true, $\neg \text{Set}^i_R$. But then $\neg \text{Set}^i_B$ must be true because of $\text{Diff}^m_R \land \neg \text{Diff}^m_R$.

**Suppose $j < i \leq m$.**

We know $\text{Diff}^j_R \rightarrow \text{Diff}^i_R$ and $\neg \text{Diff}^i_R \rightarrow \neg \text{Diff}^i_R$ from Lemma 6.3, we will use that to get that when $\text{Diff}^j_R \land \neg \text{Diff}^m_R \land \text{Set}^i_R$ then $(\text{Val}^i_B, \text{Set}^i_B) = (\text{Val}^i_R, \text{Set}^i_R)$ which allows us to then show $(\text{Set}^i_B \rightarrow (u_i \leftrightarrow \text{Val}^i_B)) \rightarrow (\text{Set}^i_R \rightarrow (u_i \leftrightarrow \text{Val}^i_R))$. 

Suppose $\neg \text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$, then $u_i^* \notin C_1 \cup C_2$ so $(\text{Val}_B^i, \text{Set}_B^i) = (\text{Val}_R^i, \text{Set}_R^i)$. But since $\text{Set}_B^i$ will be false because $u_i^* \notin C_2$, $\text{Set}_B^i$ will be false.

Now suppose $\text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$, either $u_i \in C_2$ in which case $(\text{Val}_B^i, \text{Set}_B^i) = (\text{Val}_R^i, \text{Set}_R^i)$, but since $u_i \in C_2 \text{Val}_R^i$ must be true, or $u_i \in C_1$ in which case $(\text{Val}_B^i, \text{Set}_B^i) = (\text{Val}_R^i, \text{Set}_R^i)$ or $\neg \text{Set}_B^i$, but here we know $\text{Set}_B^i$ will be forced to be true.

**Suppose $i = j$.**

$Dif_B^i \cap Dif_B^{i-1}$ and $\neg Dif_B^{i-1}$ are all true. If $\text{Set}_R^i \in \text{anno}_{x,R}(V_2 \cup W_2)$ then $\neg \text{Set}_R^i$, and if $\neg \text{Set}_R^i \in \text{anno}_{x,R}(V_2 \cup W_2)$ then $\text{Set}_R^i$. If $\text{Set}_R^i \in \text{anno}_{x,R}(V_2 \cup W_2)$ and $\neg \text{Set}_R^i$ then $u_i^* \in C_2$ and $u_i \notin C_1$. $\neg Dif_B^i$ and $\neg Dif_B^{i-1}$ means that $\neg \text{Set}_L^i$, so then $(\text{Val}_B^i, \text{Set}_B^i) = (\text{Val}_R^i, \text{Set}_R^i)$. So if $\text{anno}_{x,L}(V_1 \cup W_1)$ is satisfied by $R$ the term $\text{Set}_B^i \in \text{anno}_{x,L}(V_1 \cup V_2 \cup U^*)$ is satisfied by $B$.

If $\neg \text{Set}_R^i \in \text{anno}_{x,R}(V_R \cup W_R)$ and $\text{Set}_R^i$ then if $u_i^* \in C_1$, we know $\text{Set}_B^i \in \text{anno}_{x,L}(V_1 \cup V_2 \cup U^*)$, $\neg Dif_B^i$ and $\neg Dif_B^{i-1}$ means that $\neg \text{Set}_L^i$ is true, since $\text{Set}_B^i$ is also true then $\text{Set}_B^i$ is true. If $u_i^* \notin C_1 \cup C_2$ then $\neg \text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$, $\neg Dif_B^i$ and $\neg Dif_B^{i-1}$ means that $\neg \text{Set}_L^i$ is true, so then $(\text{Val}_B^i, \text{Set}_B^i) = (\text{Val}_R^i, \text{Set}_R^i)$. So if $\text{anno}_{x,R}(V_2 \cup W_2)$ is satisfied by $R$ the term $\text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$ is satisfied by $B$.

**Suppose $i < j$.**

If $\neg \text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$ then $u_i^* \notin C_1 \cup C_2$ and so by Lemma 6.5 $\neg \text{Set}_B^i$ is true. If $\text{Set}_B^i \in \text{anno}_{x,B}(V_1 \cup V_2 \cup U^*)$ then $u_i^* \in C_1 \cup C_2$ and so by Lemma 6.5, $\text{Set}_B^i$ is true.

We can put this all together to show in eFrege that $B \land Dif_B^{i-1} \land \neg \text{Set}_B^i \Rightarrow R, R \Rightarrow \text{con}_{R,C_2 \cup V_2 \cup V_*}(l) \Rightarrow B \land R \land Dif_B^i \land \neg \text{Set}_B^i \Rightarrow \text{con}_{R,C_2 \cup V_2 \cup V_*}(l)$, for existential literal $l$. Note that $Dif_B^i$ means that $\text{con}_{R,C_2 \cup V_2 \cup V_*}(x)$ is not satisfied by $R$ to begin with.

**Additional universal consideration.**

If $l = u_k$ then we also have to show that $\neg \text{Set}_B^k$ is preserved when $\text{con}_{R,C_2 \cup V_2 \cup V_*}(y)$ and $\neg Dif_B^{i-1}(y)$ Note that if $Dif_B^i$ then the annotation is contradicted. If $u_k \in C_1 \cup C_2$ or $\neg u_k \in C_1 \cup C_2$, for $i \leq m$ then $\neg \text{Set}_B^i$ is desired, but $\text{Set}_B^i$ will only happen when forced by $\text{Set}_B^i$ being true, but this would mean $Dif_B^i$ contradicting $\neg Dif_B^{i-1}$. If $u_k \in C_1 \cup C_2$ or $\neg u_k \in C_1 \cup C_2$ for $i > m$ then $Dif_B^m$ will contradict an annotation. $u_k \in U_1$ then the literal will not appear as such in $\text{con}_{B}(C_2 \cup V_2 \cup U^*)$ because it will now only count as a starred literal.

We have to show any universal literal $l = u_k$ or $l = \neg u_k$ that does become merged, can be removed from the disjunction. In essence we need to prove $(R \Rightarrow \text{con}_{R,C_2 \cup U_*}(l)) \Rightarrow (B \land R \land Dif_B^i \land Dif_B^{i-1} \Rightarrow (\bot))$. The essential part is that $\text{con}_{L,C_2 \cup U_*}(l)$ contains $l$ but also contains $\text{Set}_L^i$ which in turn guarantees $\text{Set}_B^i$ and forces $\text{Val}_B^i$ to be the opposite value of $l$. 

\[\square\]
